1. APMPT-4 Overview

1.1. General Description of APMPT-4

APMPT-4 is a utility-software for Microsoft Windows operating system. Specifically designed for Xtramus NuStreams chassis, APMPT-4 can perform tests in mass-production scale with pre-defined variable, and provide accurate, real-time DUT (Device under Test) status test reports.

1.2. Specifications & System Requirements

Specifications

Item	Description
Platform	NuStreams-2000(i), NuStreams-600(i) chassis
Operating System	Microsoft Windows Vista /7/8, Microsoft Windows XP
Supported Modules	Xtramus XM-RM series Rapid-Matrix modules
Built-in Tasks	<ul style="list-style-type: none">➤ Performance Task in Layer 1 (Layer1)➤ Performance Task in Layer 2 (Layer 2)➤ Performance Task in Layer 3 (Layer 3)➤ PoE (Power over Ethernet) Tasks➤ AC Tasks➤ Terminal Tasks➤ General Tasks➤ Customization Tasks
Multi-User	Support Client-Server architecture for different users
Report	Test report in text format or real-time display
Configuration	Graphic User Interface (GUI) windows

System Requirements

OS	Windows XP	Windows Vista /7/8
CPU	Pentium 1.3 GHz or higher	
RAM	512MB RAM	1GB RAM
HDD	10GB available space	

1.3. Function Description

Built-in tasks in APMPT-4 include Unicast, Flow Control, Broadcast, Filter, CRC Error, Ping, PoE, Power, Console port tasks and other tasks.

1.3.1. Performance Task in Layer 1 (PT1)

DUT OSC Test

Test the speed rate of the DUT

By using this utility, operator is able to measure oscillator's speed of DUT that is either faster or slower than standard speed in ppm scale, or use it as criteria to judge the result of test.

1.3.2. Performance Task in Layer 2 (PT2)

A. Unicast Test

Unicast transmission is to send information packets to a single destination. In layer 2 test, unique MAC address is the key of single destination as illustration below.

Perform unicast test on DUT in layer2 with different speeds, modes and various configurations.

- PT2-UC-10H (10Mbps Half Duplex),
- PT2-UC-10F (10Mbps Full Duplex),
- PT2-UC-100H (100Mbps Half Duplex),
- PT2-UC-100F (10Mbps Full Duplex),
- PT2-UC-1G (1Gbps Full Duplex),
- PT2-UC-10G (10G Full Duplex),
- PT2-UC-GROUPS (Perform Layer 2 MAC address Unicast performance test by two groups settings with different media types such as 100Mbps and 1Gbps for DUT ports with different maximum speeds)

B. Flow Control Test

Perform flow control test on DUT in layer 2 with different speeds, modes and various configurations. It tests the performance when the DUT is connected to the media type with varied kinds of speeds and directions.

- PT2-FC-10H-100H (10Mbps Half ↔ 100Mbps Half),
- PT2-FC-100H-10H (100Mbps Half ↔ 10Mbps Half),
- PT2-FC-10F-100F (10Mbps Full ↔ 100Mbps Full),
- PT2-FC-100F-10F (100Mbps Full ↔ 10Mbps Full),
- PT2-FC-100F-1G (100Mbps Full ↔ 1Gbps Full),
- PT2-FC-1G-100F (1Gbps Full ↔ 100Mbps Full),
- PT2-FC-1G-10G (1Gbps Full ↔ 10G Full),
- PT2-FC-10G-1G (10G Full ↔ 1Gbps Full),
- PT2-FC-GROUPS (Perform Layer 2 Flow Control tests by two groups with different media types such as 100Mbps and 1Gbps for DUT ports with different maximum speeds.)

C. Broadcast Test

Broadcasting refers to transmitting packets that will be received (conceptually) by every device on the network.

Perform broadcast test on DUT in layer2 with different speeds, modes and various configurations. These following tasks transmit broadcast frames (Destination Address: FF:FF:FF:FF:FF:FF).

- PT2-BC-10H, (10Mbps, Half Duplex)
- PT2-BC-10F, (10Mbps, Full Duplex)
- PT2-BC-100H, (100Mbps, Half Duplex)
- PT2-BC-100F, (100Mbps, Full Duplex)
- PT2-BC-1G, (1Gbps, Full Duplex)
- PT2-BC-10G, (10Gbps, Full Duplex)
- PT2-BC-GROUPS (Perform Layer 2 Broadcast test by two groups with different media types such as 100Mbps and 1Gbps for DUT ports with different maximum speeds.)

D. Filter Test

This filter test should filter all packets with the same source MAC address and destination MAC Address. For the test packets transmitted are all with the same source MAC address and destination MAC address and the DUT should filter this kind of packet.

Perform filter test on DUT in layer2 with different speeds,-modes and various configurations. The following tasks transmit frames with same DA (destination address) and SA (source address).

- PT2-FT-10H, (10Mbps, Half Duplex)
- PT2-FT-10F, (10Mbps, Full Duplex)
- PT2-FT-100H, (100Mbps, Half Duplex)
- PT2-FT-100F, (100Mbps, Full Duplex)
- PT2-FT-1G, (1Gbps, Full Duplex)
- PT2-FT-10G, (10Gbps, Full Duplex)
- PT2-FT_GROUPS (Perform Layer 2 Filter Test by two groups with different media types such as 100Mbps and 1Gbps for DUT ports with different maximum speeds.)

E. CRC Error Test

CRC Checksum is registered at the end of Ethernet frame.

Perform CRC (Cyclic Redundancy Check) error test on DUT in layer2 with different speeds, modes and various configurations for the last 4 bytes of CRC to be filtered. For normal DUT, frame with error CRC should be filtered. The following tasks transmit frames with CRC errors.

- PT2-CRC-10H, (10Mbps, Half Duplex)
- PT2-CRC-10F, (10Mbps, Full Duplex)
- PT2-CRC-100H, (100Mbps, Half Duplex)
- PT2-CRC-100F, (100Mbps, Full Duplex)
- PT2-CRC-1G, (1Gbps, Full Duplex)
- PT2-CRC-10G, (10Gbps, Full Duplex)
- PT2-CRC_GROUPS (Perform Layer 2 CRC check test by two groups with different media types such as 100Mbps and 1Gbps for DUT ports with different maximum speeds.)

1.3.3. Performance Tasks in Layer 3 (PT3)

A. Network Tool: Ping

Ping is a network tool used to test whether a particular host is reachable across an IP network. It is also used to self-test the network interface card of the computer, or as a speed test.

Perform Ping test on DUT in layer3 that is based on different IP addresses, subnet mask, ping IP address and gateway.

- PT3-Ping

B. Unicast Test

Unicast transmission is to send information packets to a single destination. In layer 3 test, unique IP address is the key of single destination as illustration below.

Perform unicast test on DUT in layer 3 with different speeds, mode and various configurations.

- PT3-UC-10H, (10Mbps, Half Duplex)
- PT3-UC-10F, (10Mbps, Full Duplex)
- PT3-UC-100H, (100Mbps, Half Duplex)
- PT3-UC-100F, (100Mbps, Full Duplex)
- PT3-UC-1G, (1Gbps, Full Duplex)
- PT3-UC-10G, (10Gbps, Full Duplex)
- PT3-UC-GROUPS (Layer 3 Unicast Full Performance Test. Perform Layer 3 IP Address Unicast test by two groups with different media types such as 100Mbps and 1Gbps for DUT ports with different maximum speeds.)

1.3.4. PoE (Power over Ethernet) Test

Overview of PoE

- PoE: Power Over Ethernet
 - Based on IEEE 802.3af and ongoing 802.3at
 - Protocol for DTE power via copper-based media
 - DTE (Data Terminal Equipment)
- PSE: Power Sourcing Equipment
Equipment provides the power to PD by network cable.
- PD: Powered Device
Device consumes the power from PSE by network cable. NuStream-2000i, 600i with PoE module acts as PD for the test.

A. PoE-Connect

Perform connect test on DUT (i.e. PSE) based on different configurations.

B. PoE-Disconnect

Perform disconnect test on DUT (i.e. PSE) based on different configurations.

C. PoE-Overload

Perform overload test on DUT (i.e. PSE) based on different configurations.

D. PoE-ShortCircuit

Perform short circuit test on DUT (i.e. PSE) based on different configurations.

E. PoE-Loading

Perform loading and transmitting packets test on DUT (i.e. PSE) based on different configurations.

F. PoE-Loading-GROUPS

Perform loading and transmitting packets test on DUT (i.e. PSE) based on different configurations and criteria for two groups with different media types such as 100Mbps and 1Gbps

G. POE-Dynamic Loading

Perform multiple loading and transmitting packets test on DUT (i.e. PSE) in different configurations at the same time.

1.3.5. AC Test

A. PWR-Setup

Perform power control on DUT such as power ON control and cycle reboot through test module XM-2WL1. Under the control of XM-2WL1 module on chassis, the DUT that use the power from XM-2WL1 can have ON / OFF and reboot control.

B. PWR-Check

Perform power monitor and statistics measurement from power plug into test module XM-2WL1. The outlet of XM-2WL1 also supply power to DUT, thus operator gets the power statistics measurement to DUT.

1.3.6. Terminal Test

This test includes two parts: Console and Telnet test. Perform test by executing commands by manual script or script file to RS232 interface or Telnet Server of DUT.

A. Console

Console refers to the console port, COM port or RS232 interface. This test will perform a series of standard terminal command to check the response of COM port.

B. Telnet

Perform test by executing commands by manual script file to Telnet Server of DUT.

1.3.7. General Test

Tests listed in this category include: **1 to Many-UC, 1 to Many-MCV,CALL-EXT, Inserting Waiting Time, Media Pre-setting ,Toggle MDI-II/X and Line Emulate .**

A. 1 to Many-UC

1 to Many-UC is a Unicast Full Performance Test. Performing Layer 2 MAC address Unicast performance tests from one source to multiple ports with different media types (such as 100Mbps and 1Gbps Full).

B. 1 to Many-MCV

Performing Layer 2 VLAN address multicast performance tests from one source port to multiple destination ports with different media types (such as 100Mbps and 1Gbps Full).

C. CALL-EXT

This function allows you to execute your own programs/files as APMP-4 Tasks.

D. Inserting Waiting Time

This function allows users to insert waiting time in-between tasks or to pause the whole testing process after completing a task.

E. Media Pre-Setting

Test MDIX by Media Pre-setting mode or force MDI (straight-through connection) or MDIX (crossover connection) mode of DUT.

F.Toggle MDI-II/X

Test the Auto MDIX function of different speeds/link modes of the DUT. Toggle MDI-II/X is a technology that automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately.

G. Line Emulate

This function allows you to set the device 5160 or other line simulators connecting to the DUT port. Line Emulate task must be performed ahead of the task which needs it.

1.3.8. Customization Test

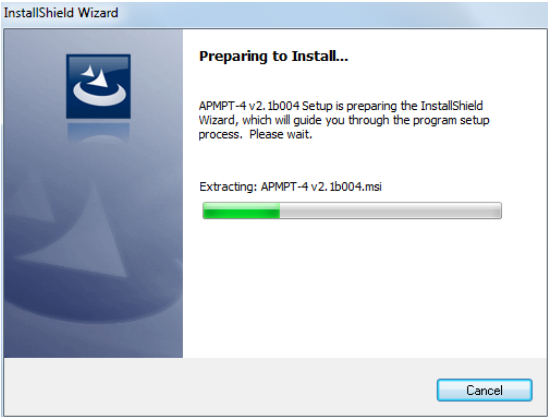

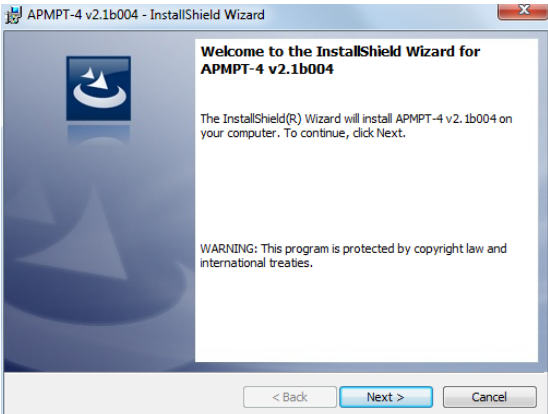

A. CTM-BSTAR-001

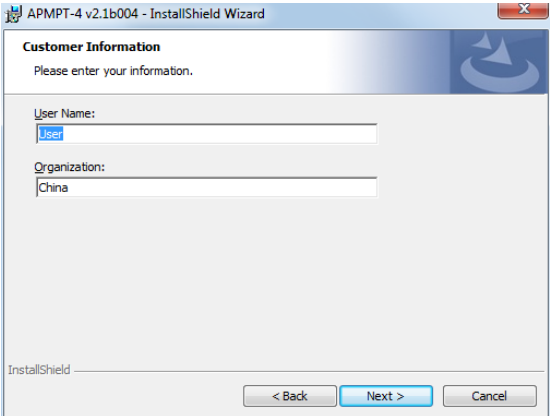

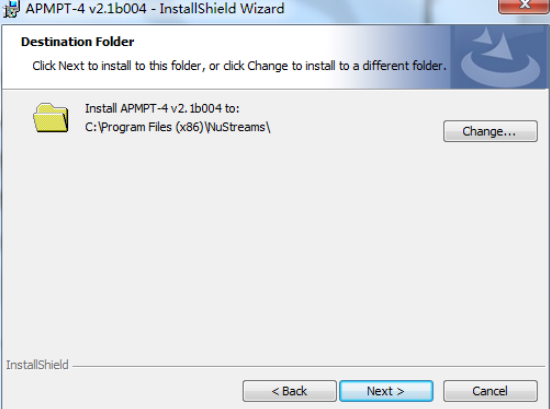

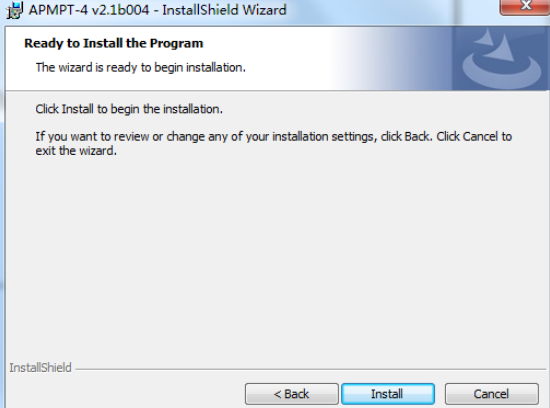

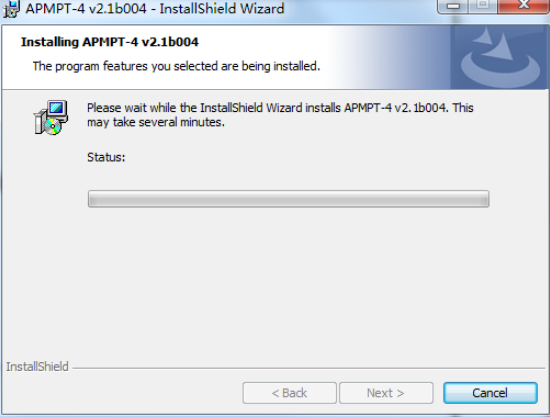

This function allows two ports to co-transmit packets in which both side can have different Tx parameters.

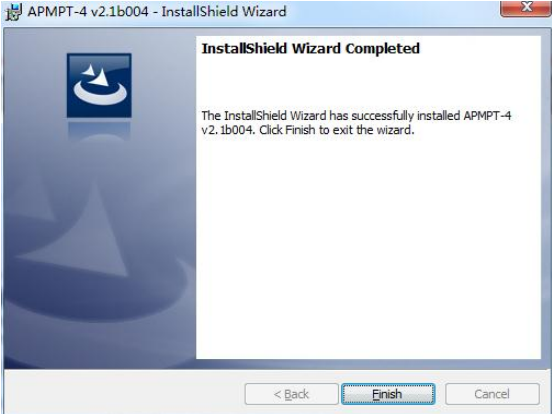

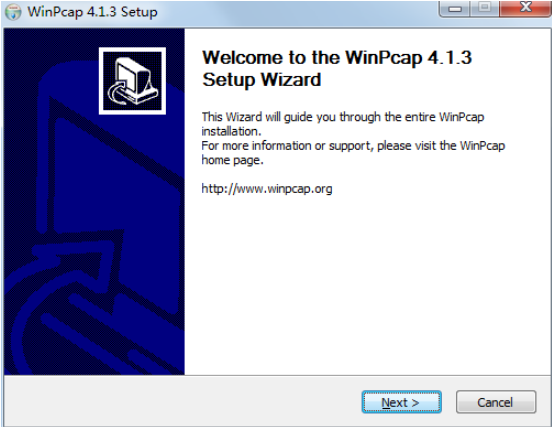

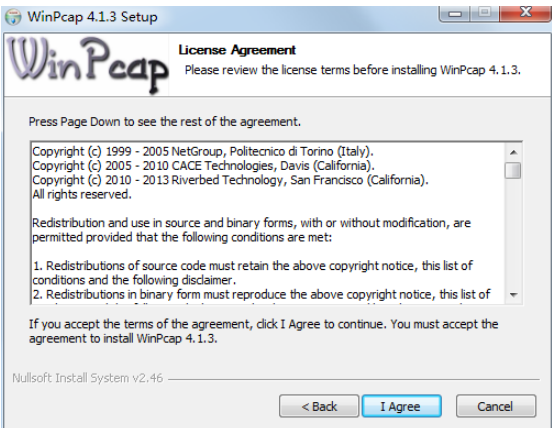

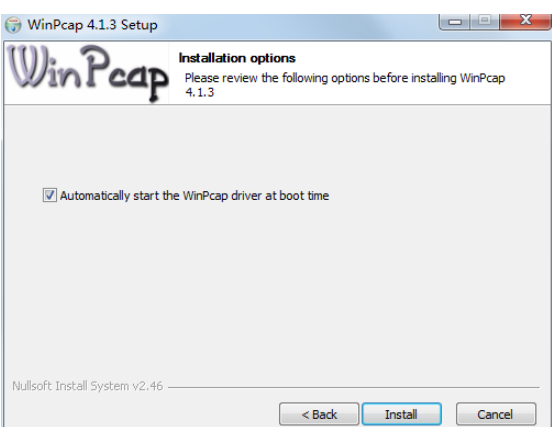

2. Software/Hardware Installation for APMPT-4

2.1. Install/Uninstall APMPT-4 on PC

Please follow the steps down below to install APMPT-4:

	<p>1. Double-click APMPT-4 installation program and start the installation process.</p>
	<p>2. InstallShield Wizard is starting to install APMPT-4. If you would like to cancel installation, click Cancel.</p>
	<p>3. Click Next to continue installation.</p>
	<p>4. Click I accept the terms in the license agreement, and click Next to continue.</p>

	<p>5. Input the User Name and Organization and click Next to continue.</p>
	<p>6. Click the Change... button to install the program to another folder, or click Next button to install the program into the default destination folder, and then continue next step. Click Back button to go back to the previous step to modify.</p>
	<p>7. Click Install to begin the installation.</p>
	<p>8. InstallShield Wizard is installing APMPT-4.</p>

	<p>9. Click Finish to exit the wizard.</p>
	<p>10. WinPcap Installer appears. Click Next button to get ready to install, or click Cancel button to stop.</p>
	<p>11. Review the license agreement before installing. Click I Agree button to continue. It is necessary to accept the agreement to install WinPcap.</p>
	<p>12. It is high recommended to check the “Automatically start the Wincap driver at boot time” as default. Then click Install.</p>

13. WinPcap is installing.

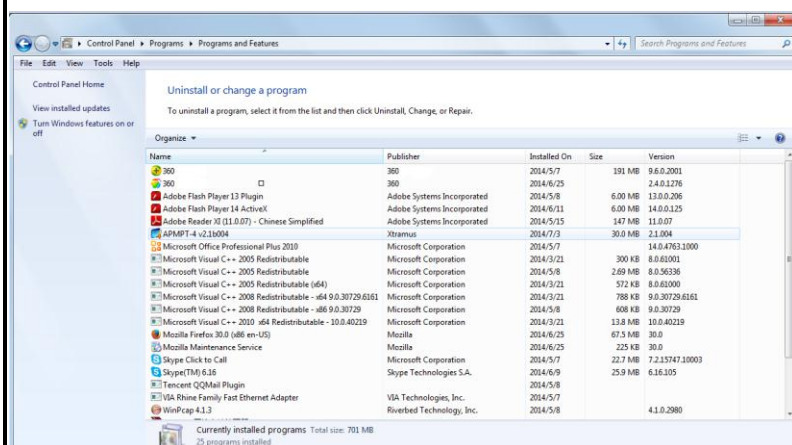

14. WinPcap installation completes. Click **Finish** button to close the wizard.

You can uninstall APMPT-4 by:

➤ Click Start → Programs → NuStreams → APMPT-4 → Uninstall APMPT-4

➤ Go to the Control Panel, choose APMPT-4 from installed program list, and click **“Uninstall”**.

2.2. Hardware Installation

Before running APMPT-4 after installation, please be sure that you've installed both the DUT and your PC with NuStreams-2000i/600i properly as shown in the illustrations down below.

For operating APMPT-4 on NuStreams-2000i and NuStreams-600i Chassis, an external PC is required. For NuStreams-2000i, connect network port of PC LAN card to DOWN (or UP) port of XM-2S19 with network cable.

For NuStreams-600i, connect network port of PC LAN card to DOWN (or UP) port of XM-2S10 with network cable.

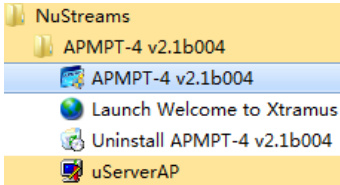

Please note that the PC's TCP/IP setting should be configured so that the PC's NIC will obtain an IP address from NuStreams-2000i/600i automatically.

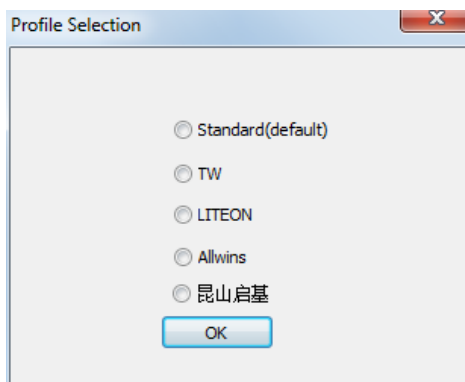

3. APMPT-4 Overview

3.1. Starting APMPT-4

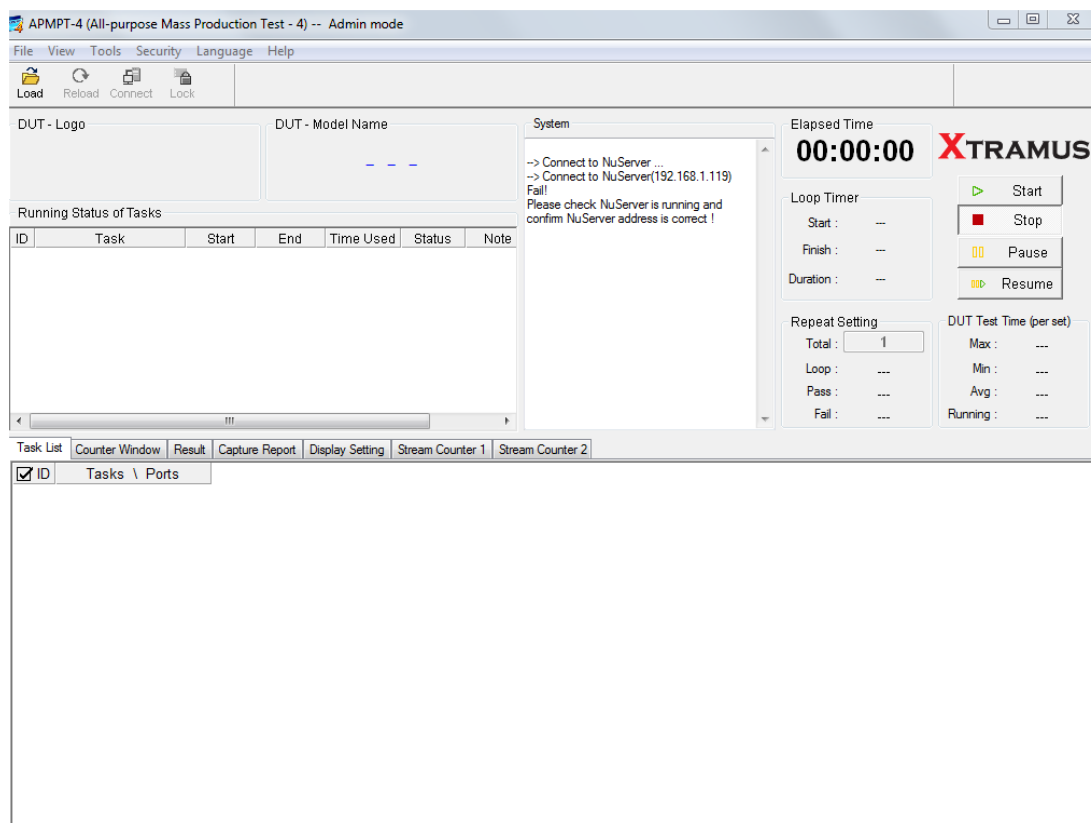

Before starting APMPT-4, the DUT, your PC, and NuStreams-2000i/600i shall be connected as shown in “2.2. Hardware Installation”.

You can start running APMPT-4 by:	
	<p>➤ Click Start → Programs → NuStreams → APMPT-4.</p>
	<p>➤ Double-click APMPT-4 icon located on your PC's desktop.</p>

When you first start the APMPT-4, a Profile Section window as below will pop up. Select **standard (default)** option in general case. If you are a user of a certain customized company, select the corresponding option.

If your PC is not connected with NuStreams-2000i/600i, you can still run APMPT-4 under Demo Mode. Almost all APMPT-4's functions are available under Demo Mode. However, please note that **Demo Mode is for system demo purposes only**, and does not serve any test purpose at all.

Please follow the steps down below to start APMPT-4:

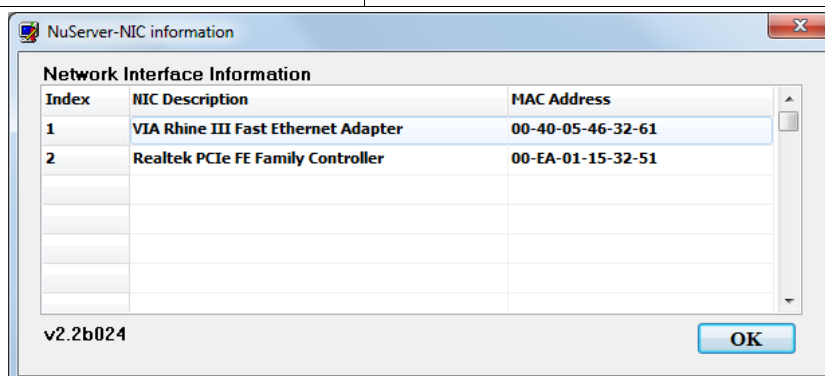

When starting APMPT-4, a “**Connect to NuServer**” window will pop up and asked how you are going to connect to NuServer.

- **Local Host:** Choose this option when you’re running APMPT-4 from NuStreams-2000i IPC module or a PC that’s connected to NuStreams-2000i/600i via an RJ45 cable.
- **Remote:** Choose this option when you’re running APMPT-4 from other PC located on the network. Choose the IP address which is assigned from NuStreams-2000i/600i from the scroll-down menu.
- **Demo:** Choose **demo** to enter APMPT-4’s Demo Mode.
- **Connect/Cancel:** Click the Connect button to connect to NuStreams-2000i/600i or click the Cancel button to quit.

If NuServer is not running while starting APMPT-4, a window will pop up and ask if you would like to run NuServer. Please click **Yes** to continue or **No** to cancel.

A “NuServer-NIC Information” window will pop up. Please select the NIC (Network Interface Card) which is connected to NuStreams -2000i/ 600i from the Network Interface Information table, and click OK. If you’re using NuStreams-2000i’s IPC module, please choose “Realtek RTL8139 Family Fast Ethernet”. NuServer will connect to the daughter boards, and APMPT-4 will start as well.

Please follow the steps down below to start APMPT-4:

When the information listed in the Nuserver window is abnormal, click **Force Disconnect**, and then click **ReConnect**.

Force Disconnect: Disconnect with NuStreams -2000i/ 600i forcefully.

ReConnect: Reconnect with NuStreams -2000i/ 600i.

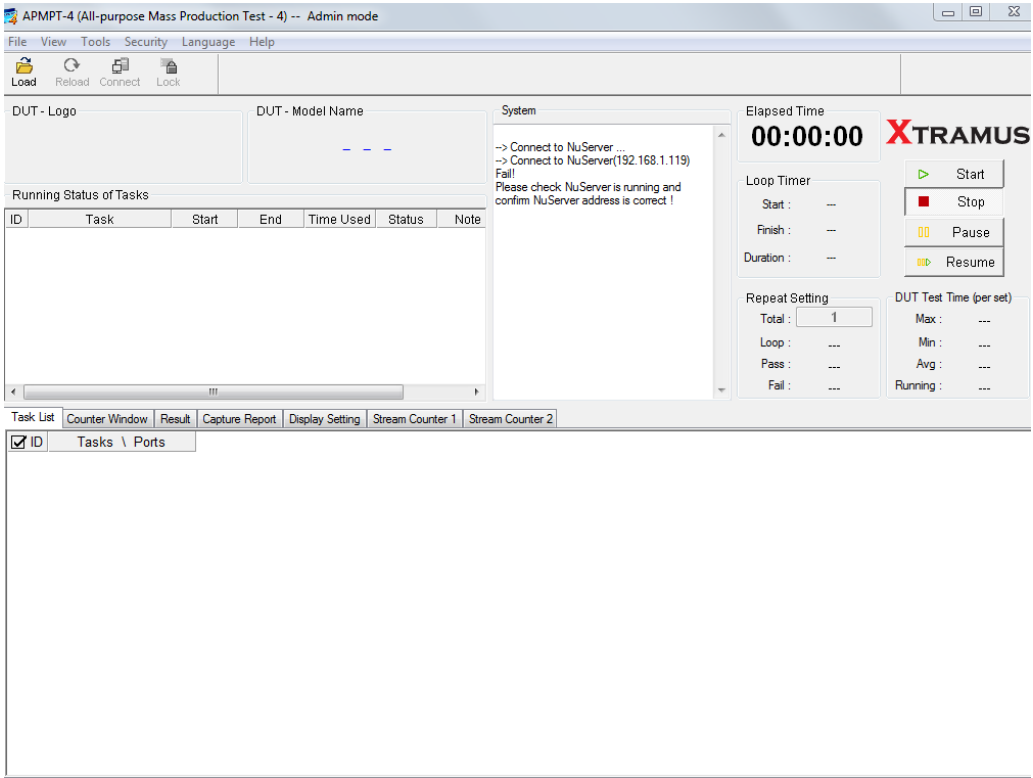

For security reasons, APMPT-4 requires Account/Password to login. The default Account/Password is:

- **Account: Admin**
- **Password: xtramustech**

Please note that **the password is case-sensitive**, and shall be changed as soon as you login for the first time. Please refer to “**3.3.4. Security**” for more information about how to change APMPT-4's password.

- **Enable auto-logout after 5 min:** Enable this function so APMPT-4 shall automatically logout after **5** minutes.
- **Login/Cancel:** Click Login/Cancel button to login or cancel.

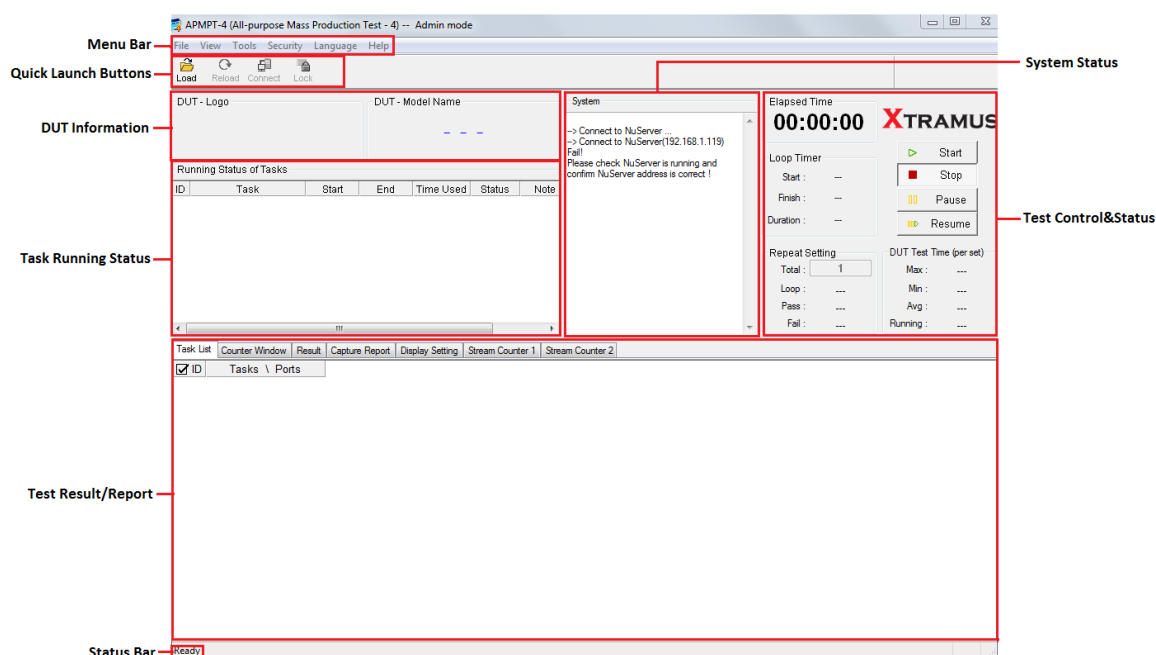

Please follow the steps down below to start APMPT-4:

You now have access to APMPT-4's main display window.

3.2. APMPT-4/NuServer Main Window Overview

APMPT-4 Main Window

Function Descriptions

Menu Bar	The Menu Bar allows you to manage test model settings, view test log/model information, set/reset APMPT-4 password, and change language displayed.
Quick Launch Buttons	The Quick Launch Buttons allow you to load/reload test model settings, connect to the NuServer, and lock test model.
DUT Information	This section of the main window contains the DUT's logo and model name.
Task Running Status	This section of the main window contains general information/status of the tasks that are currently running.
Status Bar	The Status Bar shows the APMPT-4's running status.
System Status	The System Status displays running processes of APMPT-4 system.
Test Control & Status	The Test Control & Status section contains test control buttons (which allow you to Start/Stop/Pause/Resume tests) and general test information.
Test Result/Report	This section allows you to view the test results.

NuServer

The screenshot shows the NuServer application window. It contains a table of module cards, a section for connection functions, and a section for NIC information. Red boxes and arrows highlight specific areas of interest.

Num	ID(Chassis,Slot,Port)	Card Type
1	(0, 2, 1)	XM-RM781
2	(0, 2, 2)	XM-RM781
3	(0, 2, 3)	XM-RM781
4	(0, 2, 4)	XM-RM781
5	(0, 3, 1)	XM-RM781
6	(0, 3, 2)	XM-RM781
7	(0, 3, 3)	XM-RM781
8	(0, 3, 4)	XM-RM781
9	(0, 4, 1)	XM-RM781
10	(0, 4, 2)	XM-RM781
11	(0, 4, 3)	XM-RM781
12	(0, 4, 4)	XM-RM781
13	(0, 5, 1)	XM-RM781

Module Card Information

Selected NIC Information: Force Disconnect ReConnect

NIC Description: Realtek PCIe GBE Family Controller

MAC Address: 00-E0-4C-68-14-7B

NuServer Version: v2.2b024

Annotations:

- Connection Function: Points to the ReConnect button.
- NIC Information: Points to the NIC Description and MAC Address fields.
- NuServer Version: Points to the version number v2.2b024.

Description	
Module Card Information	This section displays the information regarding to the model cards that are installed on NuStreams-2000i/600i. Model Card IDs are showed as the format of (X, Y, Z) while X is the number of the chassis (which is displayed on NuStreams-2000i/600i), Y is the slot number where this model card is installed, and Z is the available port number located on the model card.
Connection Function	You can reconnect a link down status or force to disconnect your NuStreams-600i/2000i to your PC.
NIC Information	This section displays the detail information (including NIC Model name, NIC's MAC address) regarding to the selected NIC.
NuServer Version	This section displays the version of your NuServer.

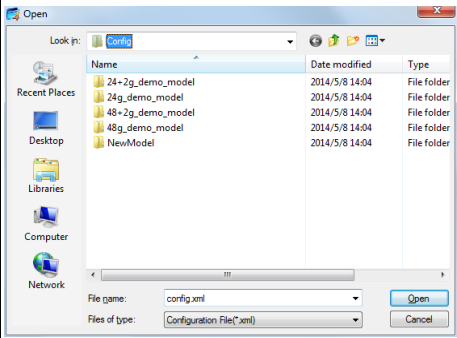

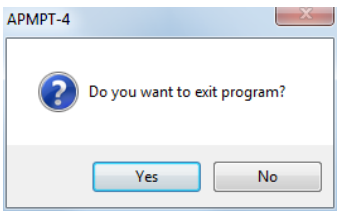

3.3. Menu Bar

File View Tools Security Language Help

APMPT-4 Menu Bar includes configuration options such as **File**, **View**, **Tools**, **Security**, **Language**, and **Help**. Please refer to the sections down below for detail information regarding to each configuration option.

3.3.1. File

File Menu Bar Overview		
New Model Wizard	Choose this option to start the New Model Wizard. The New Model Wizard allows the users to set testing options for DUT. For detail descriptions regarding to the New Model Wizard and its settings, please refer to "4. Creating Task via New Model Wizard".	
Load Model		<p>Load a previously-saved configuration file and apply these settings to APMPT-4.</p> <p>All the configurations you've made via New Model Wizard will be saved as a ".xml" file, along with several ".cfg" files.</p> <p>Please note that these ".cfg" files contain test settings as well. Deleting them will cause your ".xml" file unable to load properly.</p>
Modify Model	Choose this option to make changes to the current test settings for DUT. For detail descriptions regarding to these settings, please refer to the section down below.	
Exit		<p>A prompt pop-up window will ask if you are sure to exit APMPT-4. Click Yes to exit APMPT-4, or click No to cancel.</p>

3.3.2. View

View																																																																																									
Latest Log	Choose Latest Log allows you to view the latest test log file (in “*.txt” format).																																																																																								
Log Folder	Choose Log Folder , and then the folder where all the saved test logs of the current test model will be opened.																																																																																								
Model Folder	Choose Model Folder , and then the folder where all the DUT model configuration files are saved will be opened. The default Log folder file path is under “C:\Program Files\NuStreams\APMPT-4 v2.1b004\config”.

NuServer	Display the NuServer window. For more information regarding to NuServer window, please refer to “3.2. APMPT-4/NuServer Main Window Overview”.																																																																																								
Simple Style	Choose Simple Style will make you run the tests under a simple mode.																																																																																								

3.3.3. Tools

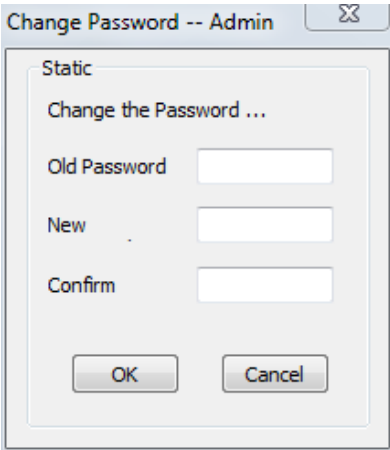

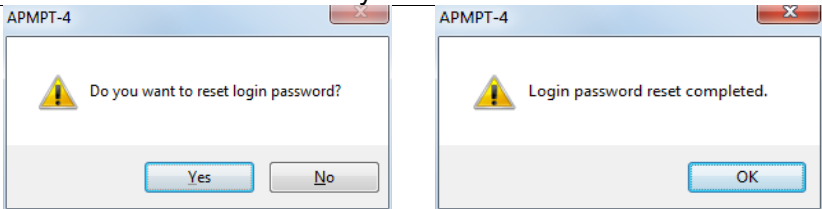

Tools	
Import DUT Logo	<div data-bbox="689 398 1129 649" data-label="Image"> </div> <p>You can load an image file that represents the DUT for testing via Import DUT Logo function. The image file you chose will be shown on DUT Logo field of the Main Window.</p> <ul style="list-style-type: none"> • Logo Preview: The image you've chosen will be displayed in this field for preview. • Import: Click this button to choose the image file that will be displayed. • OK: Click this button to apply the changes you've made. • Cancel: Click this button to abandon all the changes you've made and exit Import Logo Window.
TW Barcode System Setting	<p>The Setting is for TW Barcode System</p>
Force to Release Module	<p>When the test encounters some unexpected problems which lead the board dead, or other tests need to lock the current board, you can choose Force to Release Module to obtain the board again.</p>

3.3.4. Security

APMPT-4 can run under **Admin Mode** and **Operator Mode**:

- **Admin Mode:** Users have the maximum authorization and can access all APMPT-4's functions.
- **Operator Mode:** Users are only allowed to access APMPT-4's basic functions such as loading saved DUT model test settings and view latest test log/module card information/NuServer

Security	
Logout	Logout from Admin Mode and switch APMPT-4 to Operator Mode.
Login/Change Account	Login to the Admin Mode.
Change Password	<div>  </div> <p>You can change the password for Admin Mode here. For security reasons, it is recommended to change APMPT-4's password after you first login.</p> <ul style="list-style-type: none"> • Old Password: Enter the old password here. • New: Enter the new password here. The new password should be 6~12 characters and mustn't contain special symbols. • Confirm: Please type your new password again for confirming. • OK: Apply all the changes you've made and apply. • Cancel: Cancel and abandon all the changes you've made.
Reset Password	<div>  </div> <p>If you forget APMPT-4's Admin Mode password, you can reset the password to the default password "xtramustech".</p> <p>Click Yes to start resetting the login password (or No to cancel), and click OK to complete.</p>
Always login in OP Mode	Every time when APMPT-4 starts running, it will run under Operator Mode.

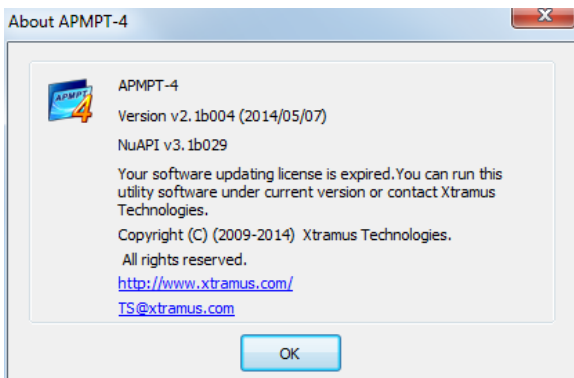

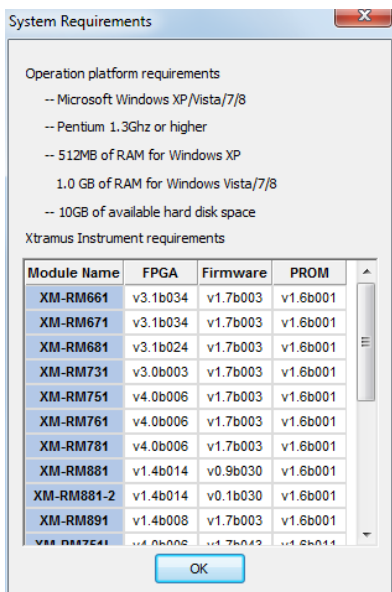

3.3.5. Language

Language	
English/ Chinese Simplified	APMPT-4 has 2 different languages for its UI available. You can set the language of UI to either English or Simplified Chinese .

3.3.6. Help

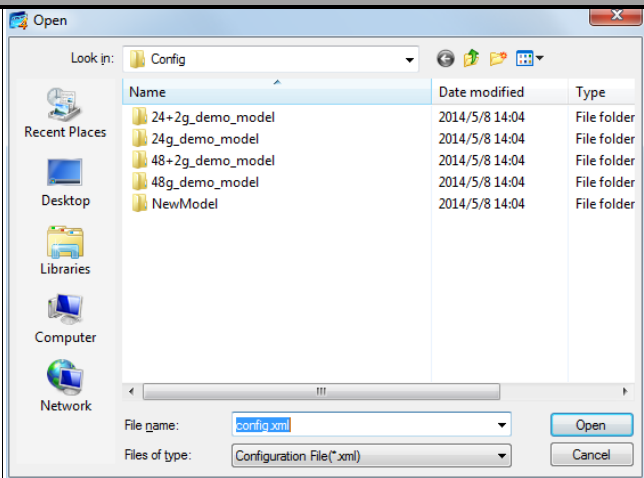

Help	
About APMPT-4	 <p>The About APMPT-4 window will pop up and show detailed system information.</p>
Xtramus Web	Click this option to access to Xtramus official website.
System Requirement	 <p>The "System Requirements" window will pop up and show the requirements for your PC and the FPGA/Firmware/PROM version limit of the module cards. Click the Ok button to exit the "System Requirements" pop up window.</p>

3.4. Quick Launch Buttons

The Quick Launch Buttons allow you to Load/Reload DUT Model Settings, Connect to NuServer, or Lock a Module Card on the Chassis.

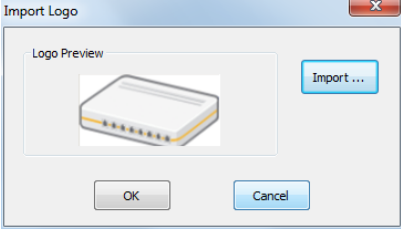

Quick Launch Buttons

		<p>The Load Quick Launch Button serves the same function as Load Model on the Menu Bar.</p> <p>Clicking this button allows loading a previously-saved configuration file and applies these settings to APMPT-4.</p> <p>All the configurations you've made via New Model Wizard will be saved as a ".xml" file, along with several ".cfg" files.</p> <p>Please note that these ".cfg" files contain test settings as well. Deleting them will cause your ".xml" file unable to load properly.</p>
		<p>APMPT-4 will reload the current opened DUT model setting and apply all these settings.</p>
		<p>The Connect button allows you to re-connect to the NuServer if it is not connected while initializing APMPT-4.</p>
		<p>Clicking the Lock button allows the user to lock a specific module card installed on a NuStreams-600i/2000i chassis.</p>

3.5. DUT Information

The **DUT Information** on APMPT-4 Main Window displays the DUT’s Logo and Model Name.

DUT Information	
DUT – Logo	<div></div> <p>You can load an image file that represents the DUT from your PC, and apply it as DUT - Logo for reference via Import DUT Logo function located on the Menu Bar. The image file you chose will be shown here.</p> <div></div>
DUT – Model Name	<p>When making configurations in New Model Wizard, you can input a model name under Model Name field. For detailed information, please refer to “4.1. Selecting Active Ports from Installed Module Cards”. The model name you input will be shown here.</p> <div></div>

3.6. Task Running Status

Running Status of Tasks						
ID	Task	Start	End	Time Used	Status	Note
1	PT2-UC-10H	13:47:49	13:48:10	00:00:21	Pass	
2	PT2-UC-10F	13:48:10	13:48:27	00:00:17	Pass	
3	PT2-UC-100H	13:48:27	13:48:49	00:00:22	Pass	
4	PT2-UC-100F	13:48:49	13:49:05	00:00:16	Pass	

The **Task Running Status** displays general information/status of the tasks that are currently running. The **Task Running Status** is blank if no DUT Model Setting is loaded to APMPT-4.

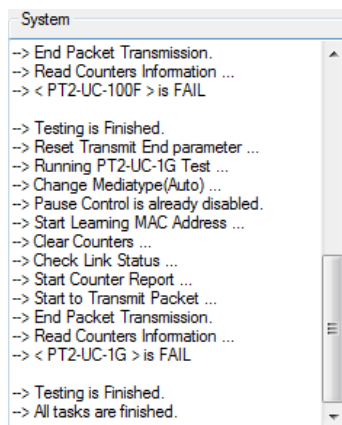

Description	
ID	Task ID. Tests will be performed
Task	Name of the Task.
Start	The start time of the task.
End	The end time of the task.
Time Used	Display time used with the task.
Status	Task Pass/Fail/Done.
Note	Notes regarding to the task.

3.7. Status Bar

The **Status Bar** located on the bottom-left of APMPT-4 Main Window shows the task APMPT-4 is currently running and its progress.

3.8. System Status

The **System Status** shows detailed information of APMPT-4's system status and what APMPT-4 is currently processing.

3.9. Test Control & Status

Elapsed Time

00:00:19

XTRAMUS

Loop Timer

Start : 05/13 14:31:57

Finish : 05/13 14:32:16

Duration : 00:00:19

Repeat Setting

Total :

Loop : 1

Pass : 0

Fail : 1

DUT Test Time (per set)

Max : 00:00:19

Min : 00:00:19

Avg : 00:00:19

Running : 00:00:19

The **Test Control & Status** allows user to control testing process via control buttons and view general information regarding to test time.

Loop Timer	
Start/Finish	This section displays the starting/finishing time (including date) of the test.
Duration	This section displays the maximum duration of time spent on one single loop.

Repeat Setting	
Total	You can set the how many times you would like to repeat all the tests here in this field.
Loop	This section displays the current number of test loop.
Pass/Fail	This section displays how many times the tests have been passed/failed.

Elapsed Time	
Elapsed Time	This section displays duration of time spent on the whole testing process.

Task Control Buttons	
<div> <p>Start</p> <p>Stop</p> <p>Pause</p> <p>Resume</p> </div>	<p>The Task Control Buttons allow you to control the testing process.</p> <ul style="list-style-type: none"> • Start: Click this button to start DUT test. • Stop: Click this button to stop DUT test. If you click Start button again afterwards, DUT test will start from the beginning. • Pause: Click this button to pause DUT test. This DUT test can be resumed later on. • Resume: Click this button to resume a previously paused DUT test.

DUT Test Time (per set)	
Max/Min	Maximum/Minimum period of time used when performing one set of tasks.
Avg	The average period of time used when performing one set of tasks.
Running	The total time used to perform the tasks.

4. Creating Task via New Model Wizard

When performing tests on your DUT with APMP-4 for the first time, you have to create a new set of test settings for the DUT.

Before starting to create a new task via New Model Wizard, please be sure that:

- All module cards (such as XM-RM751, XM-RM761, or XM-RM781) are installed on chassis (such as NuStreams-2000i/600i) properly.
- The chassis (such as NuStreams-2000i/600i) is powered-on and is connected to a PC according to “**2.2. Hardware Installation**”.

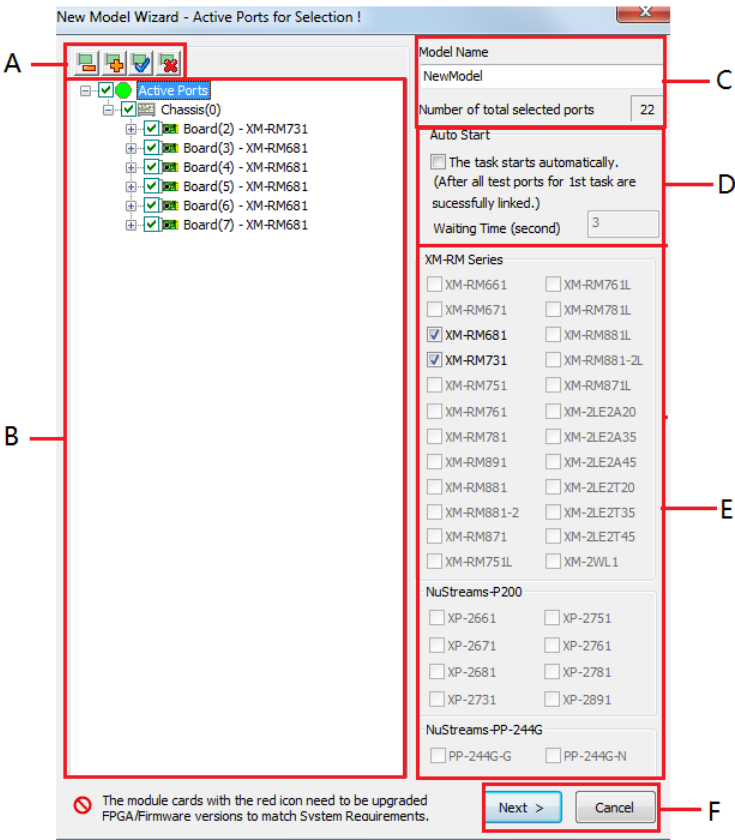

To start using New Model Wizard, please click **File** on the Menu Bar, and choose **New Model Wizard** as shown in the figure down below.

A “**New Model Wizard – Active Ports for Selection!**” window will pop up. All module cards that are installed on the chassis will be displayed here.

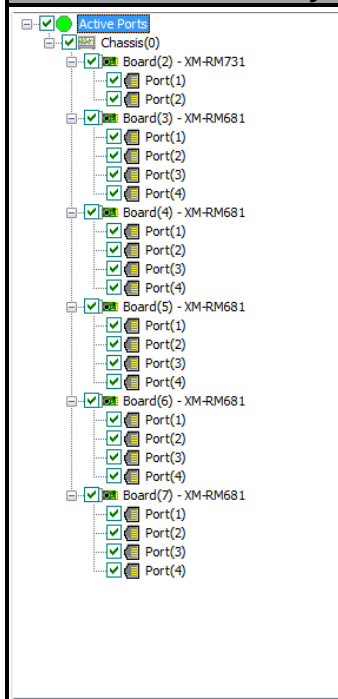

Please refer to the sections down below and start creating test tasks for your DUT.

4.1. Selecting Active Ports from Installed Module Cards

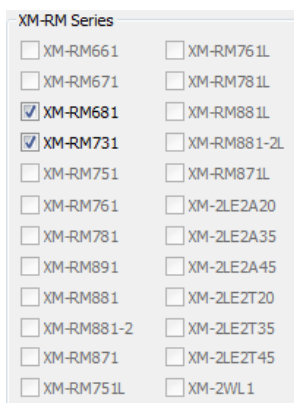

A. Tree Style Tab Buttons	
	These two buttons allow you to unfold/fold all the Active Port tree style tab displayed in B.
	These two buttons allow you to check/uncheck all the Active Port displayed in B.

B. Active Port Tree Style Tab & E. Module Card List

All the module cards, along with their Active Ports are listed here in this field. You can fold/unfold the tree style tab by clicking / icons. Also, you can check/uncheck the port by clicking icon.

Also, you can check which module card and its Active Ports are activated for tests in **E. Module Card List** as well. Click the check box in front the module card you would like to activate/deactivate.

C. DUT Model Name & Active Port Count

Model Name
NewModel

Number of total selected ports 22

You can input DUT's model name here in this field.

Please note that a folder named after the model name you input here will be created under "**config**" folder inside APMPT-4's folder (Default path: **C:\Program Files\NuStreams\APMPT-4 v0.9b060\config**), and all the configuration files and test logs will be saved to that folder.

This field display how many ports you've been activated for now.

D. Auto Start

Auto Start

☐ The task starts automatically.
(After all test ports for 1st task are successfully linked.)

Waiting Time (second) 3

If you would like APMPT-4 to start the test automatically (with delay in a few seconds) without having to press the Start button located on the Main Window, check the check-box here and input the delay time in the field down below.

F. Next>/Cancel

Next >

Cancel

Click this button to apply all the changes you've made and move on to the **New Model Wizard - The Ports of New Model -- Preview and Confirm!** window.

Click this button to abandon all the changes you've made and go back to the Main Window.

New Model Wizard - The Ports of New Model -- Preview and Confirm !

No.	Port	Type
1	(0, 2, 1)	XM-RM731

< Back Next > Cancel

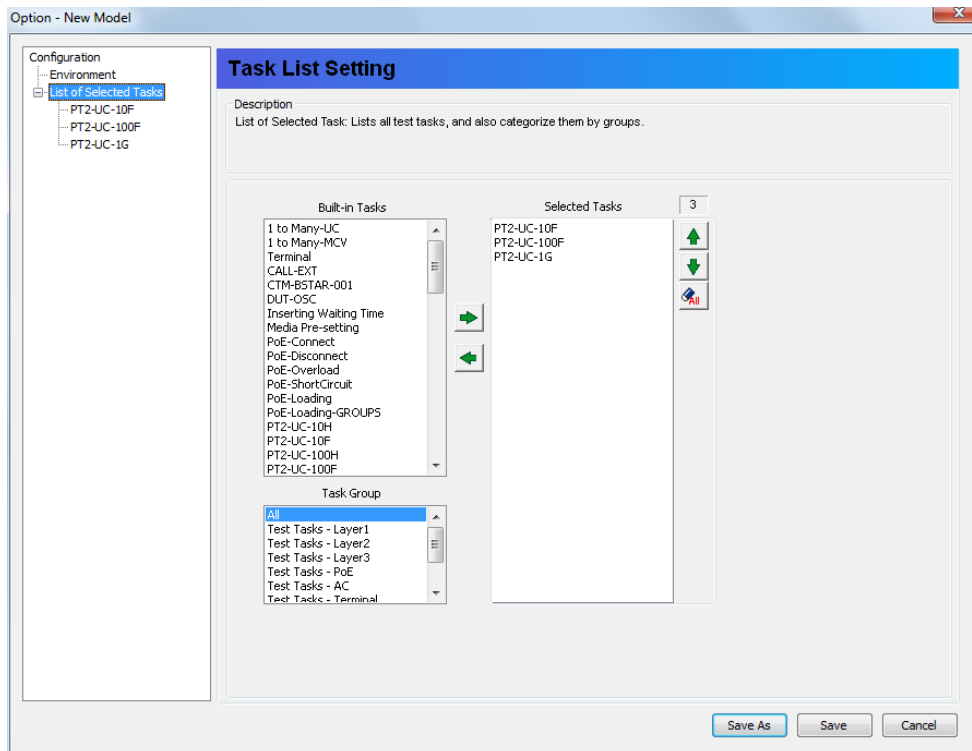

After finishing the module cards/Active Ports for the tests, you can review all the ports, module cards, and model name on **New Model Wizard - The Ports of New Model -- Preview and Confirm!** window.

Click **Next >** to start making detail task settings or click **< Back** to go back to **Select Active Ports** window.

Also, you can click **Cancel** to abandon all the changes you've made and go back to the Main Window.

4.2. Making Settings on Option – New Model Window

An **Option – New Model** window will show up after you've selected module cards and Active Ports. The **Option – New Model** window allows you to make detail test configurations.

APMPT-4 has two different kinds of configurations: **Environment Setting** and **Task List Setting**.

- **Environment Setting:** Configure global settings of the test environment for all tasks.
- **Task List Setting:** All test tasks are listed and categorized by groups. All tasks added to the **Selected Tasks** field will be listed under this category and can be configured in detail.

For more detail information and descriptions regarding to these settings, please refer to the sections down below.

4.2.1. Configuring Environment Setting

To access **Environment Setting** and start configuring global settings of the test environment for all tasks, please click **Environment** from the Configuration Tree Style Tab located on the left side of **Option – New Model** window as shown in the figure above.

Environment Setting

Description
Environment Setting: Configure global setting of the test environment for all tasks.

Final Report Window: It includes **Default**, **Pass only** and **Fail only** options, in which Default will show all the test result, Pass only will only show the passed test and Fail only will only show the failed test.

Upload Data to MES: If you enable the **Upload Data to MES** function, the **Database Setup** button will be available. Clicking the **Database Setup** button will pop up a **Database Setup** window for settings. The **Database Setup** window allows you to set your **Driver Type** and allows you to define your **User ID**, **Password**, **Server Name**, **Database Name** and **Table Name**.

Besides, you can also **Set Number** of Item (up to 20 items) to be displayed and click **Apply** button to confirm. You can scroll down each Source Data's field to indicate it as **Work Area**, **SN1**, **OP_ID**, **Time_Start**, **Time_End**, **Time_Used**, **Model_Name**, **DUT_MAC** or **Final_Result**.

4.2.2. Adding/Removing Tasks via Task List Setting

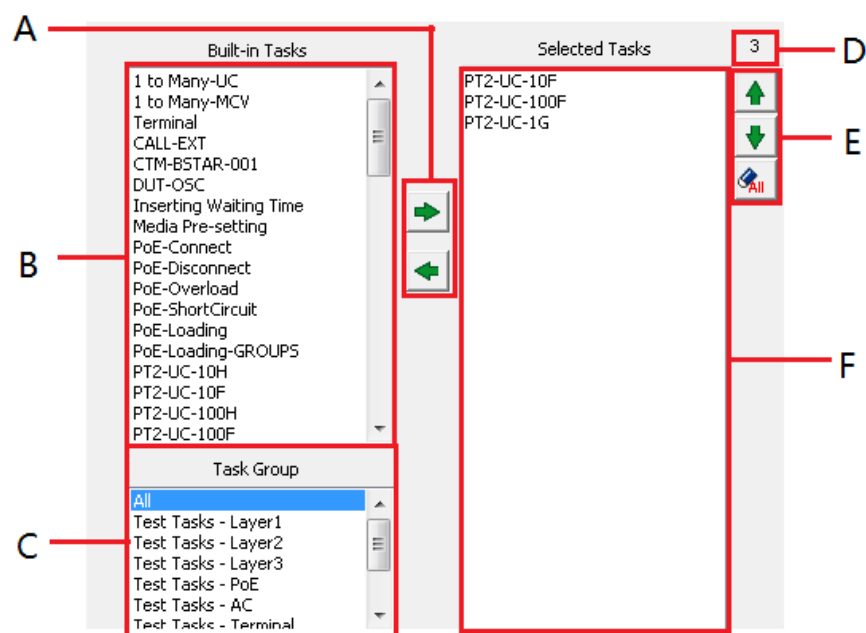

Under **Task List Setting**, you can:

- View all APMPPT-4's available tasks according to their groups.
- Add/Delete task that you would like to perform.
- Arrange order of the tasks.

To start managing tasks for your DUT, please click **List of Selected Tasks** on the left side of the **Option – New Model**.

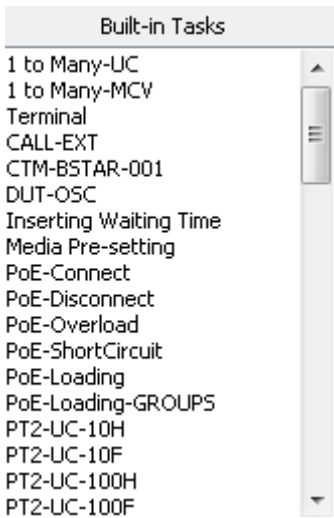

A. Task Add/Remove Buttons

The **Task Add/Remove Buttons** allow you to add or remove tasks to/from **Selected Tasks**.

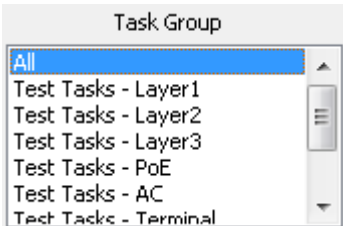

- By clicking  button, you can add the task you've selected from **Built-in Tasks** field in the left-side to the **Selected Tasks** in the right-side.
- By clicking  button, you can remove the task you've selected from the **Selected Tasks** in the right-side.

B. Built-in Tasks & C. Task Group Selection

The screenshot shows a scrollable list of built-in tasks. The list includes: 1 to Many-UC, 1 to Many-MCV, Terminal, CALL-EXT, CTM-BSTAR-001, DUT-OSC, Inserting Waiting Time, Media Pre-setting, PoE-Connect, PoE-Disconnect, PoE-Overload, PoE-ShortCircuit, PoE-Loading, PoE-Loading-GROUPS, PT2-UC-10H, PT2-UC-10F, PT2-UC-100H, and PT2-UC-100F.

The **Built-in Tasks** display tasks available in APMPT-4. You can choose which tasks you would like the system to display on **Built-in Tasks** field with the **Task Group Selection** scroll-down menu.

- **All:** Display all tasks available.
- **Test Tasks – Layer 1:** Display all available Layer 1 tasks.
- **Test Tasks – Layer 2:** Display all available Layer 2 tasks.
- **Test Tasks – Layer 3:** Display all available Layer 3 tasks.
- **Test Tasks – PoE:** Display all available PoE (Power over Ethernet) tasks.
- **Test Tasks – AC:** Display all available AC (Power) tasks.
- **Test Tasks – Terminal:** Display all available Terminal tasks.
- **Test Tasks – General:** Display all available general tasks.
- **Test Tasks – Customization:** Display all available Customization tasks.

To add a task to **Selected Tasks**, please click the task you would like add in **Built-in Tasks**, and click  button.

D & F. Selected Tasks

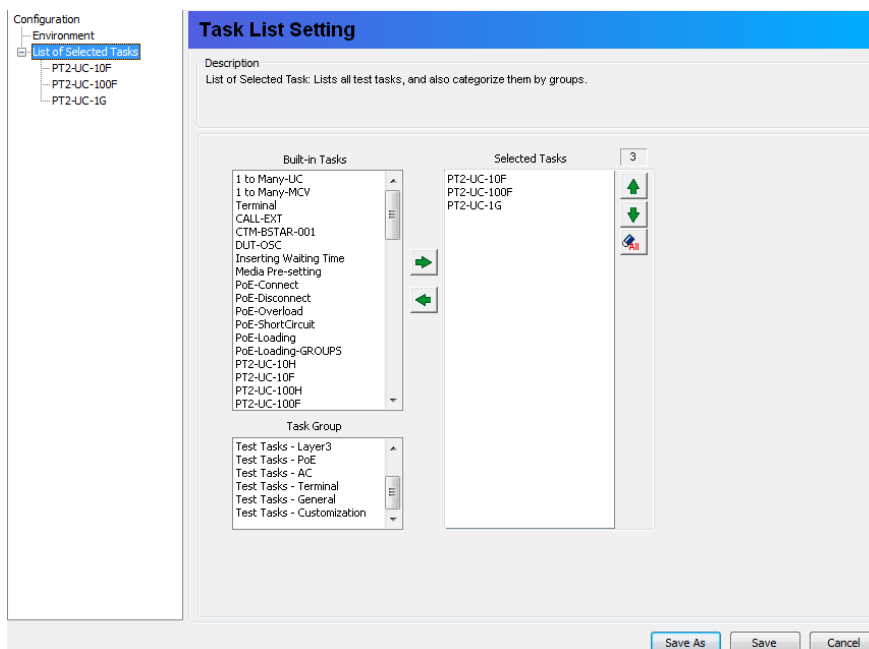

<div data-bbox="135 212 438 257"> <div>Selected Tasks</div> <div>3</div> </div> <div data-bbox="135 280 438 369"> PT2-UC-10F PT2-UC-100F PT2-UC-1G </div>	<p>All tasks you've selected from Built-in Tasks field will be listed in the Select Tasks. The number of the tasks you chose will be shown here as well.</p> <p>To remove a task from Selected Tasks, please click the task you would like to remove here, and click  button.</p>
---	---

E. Selected Tasks Managing Buttons

<div data-bbox="183 548 239 694">    </div>	<p>You can manage the testing order of tasks listed in the Selected Tasks.</p> <p>To move the priority of a task listed in Selected Tasks up, click on that task, and click  button; to move the priority of a task listed in Selected Tasks down, click on that task, and click  button.</p> <p>If you would like to remove all the tasks listed in Selected Tasks, click  button.</p>
--	--

4.2.3. Configuring Tasks Listed on List of Selected Tasks

After choosing the tasks you would like to perform from **Built-in Tasks** as mentioned in “4.2.2. Task List Setting”, you can start making detail settings with individual tasks by clicking the task you would like to configure from **List of Selected Tasks**. All the configurations for this task will be listed in the right-side section as shown in the figure down below.

Please note that the maximum number of tasks that can be selected into the **List of Selected Tasks** is **32**.

As mentioned in “4.2.2. Task List Setting, B. Built-in Tasks & C. Task Group Selection”, all tasks available for APMPT-4 can be divided into different groups **Layer 1**, **Layer 2**, **Layer 3**, **PoE (Power over Ethernet)**, **AC (DUT Power Test)**, **Terminal**, **General** and **Customization**.

For more detailed information regarding to task settings in APMPT-4’s task groups, please refer to “5. APMPT-4 Detail Task Setting.”

You can use the three buttons to save the settings.

- **Save:** Click this button, a “Save As” window as below will pop up and prompt you to save all the configurations you made.’

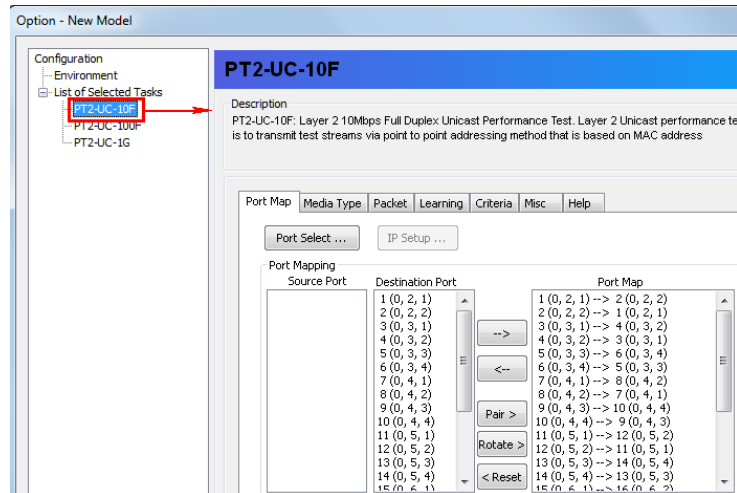

- **Save As:** Click this button, a “Save As” window will pop up and you can save your configurations into another file.
- **Cancel:** Click this button, a reminder window as below will pop up. Click **OK** to exit the **Option – New Model** window. Or click **Cancel** to return to the **Option – New Model** window.

The default name for the configuration setting is “**config**” and will be saved in a folder named after the DUT’s **Model Name**. All configuration setting files are saved as **XML** format, and changing configuration setting’s file type may cause APMPT-4 unable to load your previous saved setting file. APMPT-4 will apply all the settings you’ve made after saving.

5. APMPT-4 Detail Task Setting

As mentioned in “4.2.3. Configuring Tasks Listed on List of Selected Tasks”, you can make detail settings with individual tasks by clicking the task you would like to configure from **List of Selected Tasks**. All the configurations for this task will be listed in the right-side section as shown in the figure down below.

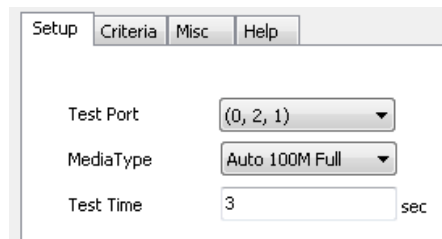

All tasks available for APMPT-4 can be divided into different groups **Layer 1**, **Layer 2**, **Layer 3**, **PoE (Power over Ethernet)**, **AC (DUT Power Test)**, **Terminal**, **General** and **Customization**. Please refer to “1.3. Function Description” for detail descriptions. Also, descriptions for each task can be viewed on APMPT-4 as well.

5.1. Test Tasks - Layer 1: DUT-OSC

APMPT-4 will start examining Crystal Oscillator's frequency of the DUT and see if it's either faster or slower than standard speed in ppm scale.

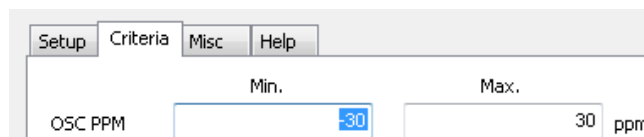

5.1.1. Setup

The Setup tab shows three configuration fields: 'Test Port' with a dropdown menu showing '(0, 2, 1)', 'MediaType' with a dropdown menu showing 'Auto 100M Full', and 'Test Time' with a text input field containing '3' and a unit label 'sec'.

- **Test Port:** Select the module card and the port that will be used for DUT-OSC test. The Test Port available are showed as IDs in the format of **(X, Y, Z)** while **X** is the number of the chassis (which is displayed on NuStreams-2000i/600i), **Y** is the slot number where this model card is installed, and **Z** is the available port number located on the model card.
- **Media Type:** Click the Media Type scroll-down menu to choose DUT's link speed.
- **Test Time:** You can set the testing time for the Layer 1 DUT-OSC task.

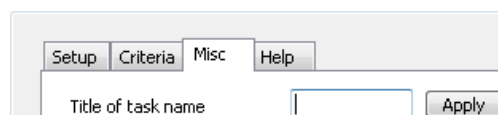

5.1.2. Criteria

The Criteria tab shows two input fields for 'OSC PPM'. The 'Min.' field contains '-30' and the 'Max.' field contains '30'. Both fields are followed by the unit 'ppm'.

- **OSC PPM Min/Max:** Please input the minimum/maximum frequencies (ppm) which will serve as DUT-OSC Task's testing criteria.

5.1.3. Misc

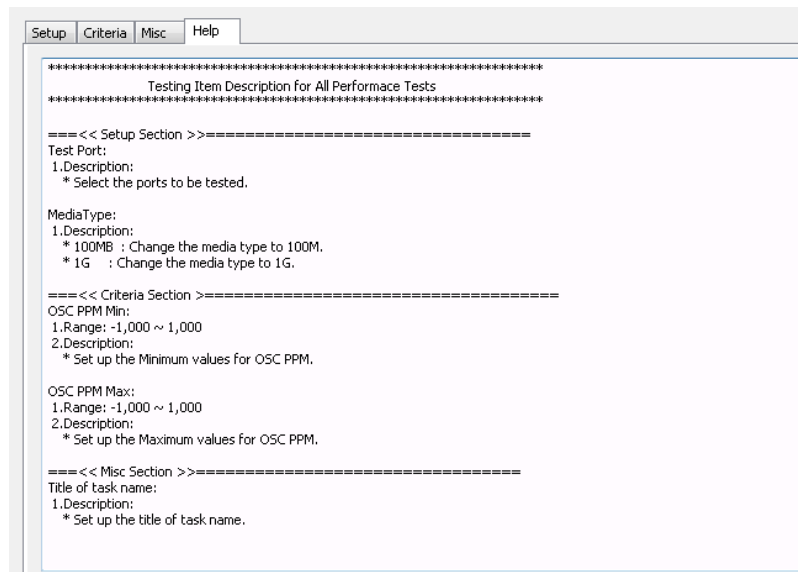

The Misc tab shows a text input field labeled 'Title of task name' and an 'Apply' button.

- **Title of task name:** You can assign a name to this task for identification.
- **Apply:** Apply the changes you made.

5.1.4. Help

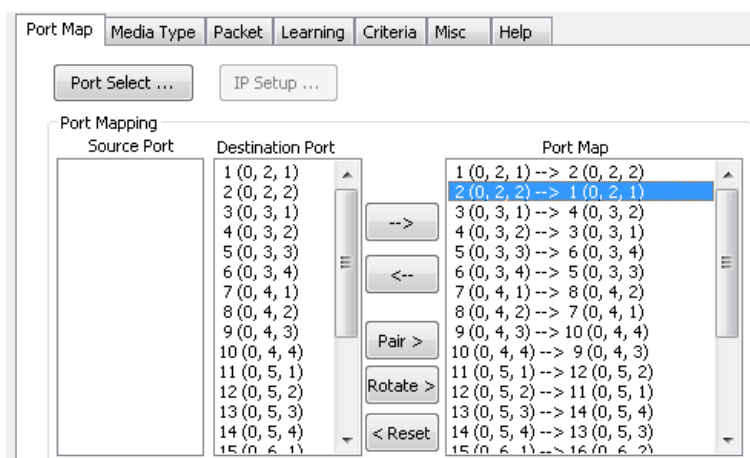

All test variables used for this task and their definitions will be listed here for reference.

5.2. Test Tasks – Layer 2

All settings regarding to Layer 2 tasks can be set here. For available Layer 2 tasks and their descriptions, please refer to “1.3.2. Performance Task in Layer 2 (PT2).”

5.2.1. Port Map

- **Port Select ...:** By clicking this button, a **Select Ports for Testing** window will pop up, allowing you to select the module cards and the ports you would like to use for the task.
- **IP Setup ...:** For layer2 tasks, the **IP Setup** button presents gray, which serves no function under here.
- **Source/Destination Port:** These two fields display the source/ destination port for the task. Ports are displayed in IDs in the format of **(X, Y, Z)** while **X** is the number of the chassis (which is displayed on NuStreams-2000i/600i), **Y** is the slot number where this model card is installed, and **Z** is the available port number located on the model card.
- **Port Map:** This field shows how test streams will be transmitted from port to port.
- **→:** To assign how test streams flow from source port to the destination port, click a port from **Source Port**, click a port from **Destination Port**, and then click **→** button to add them to the **Port Map**.
- **←:** To remove a port map setting from **Port Map**, click the setting you would like to remove, and then click **←** button to remove it from **Port Map**.
- **Pair >:** APMPT-4 will match ports located on the same module card in a back-and-forth manner, and add them to the **Port Map**.
- **Rotate >:** APMPT-4 will match ports so the last port will connect to the first port, thus forming a loop. If you have the same amount of ports on your chassis and DUT, **Rotate** allows you to test all DUT's ports simultaneously.
- **Reset <:** Reset all port map settings in the **Port Map**.

5.2.2. Media Type

- Media Type:** By clicking the scroll-down menu, you can set the transmitting mode to **Auto** (with auto-negotiation), **Force** (without auto-negotiation), or **Off** (all the ports in this task are link-down). If you are setting PT2 tasks such as **PT2-UC-GROUPS**, **PT2-FC-GROUPS**, **PT2-BC-GROUPS**, **PT2-FT-GROUPS**, and **PT2-CRC-GROUPS**, the **Media Type** will be replaced by a **Custom** button. As shown in the figure down below, a **Media Type Group Setup** window as below will pop up.

A. MediaType Group Setup

Group ID	MediaType
1	Auto 100F
2	Auto 100F

You can set the MediaType by group in this section.

- Number of Group:** You can choose the number of the group from the scroll down menu, and then you can set the media type of the group in the area down below. The number of the group is from 1 to 4.
- Group ID:** This field lists the ID numbers of the groups which are available for media type settings.
- MediaType:** You can choose the media type for a group from the scroll down menu.

B. Port List by Single Group(View)

Port List by Single Group (View)

Group ID

2

Ports list	Group ID
(0, 3, 3)	2
(0, 3, 4)	2
(0, 4, 1)	2
(0, 4, 2)	2

You can view all the ports of a single group in this section.

- **Group ID:** Choose the number of a group, and then you can see the ports information of this group listed in the area down below.
- **Ports list:** the position information of the port.
- **Group ID:** the number of the group.

C. Quick Setting Port Group

Quick Setting Port Group

Port From

5

To

8

Group

2

Apply

You can set the consecutive ports into a same group in this section.

- **Port Form:** Input the ports you want to group.
- **Group:** Select the group from the scroll down menu.
- **Apply:** Click this button to make your settings effective.

D. Port Group Setup

Port Group Setup

No.	Ports list	Group ID
1	(0, 2, 1)	1
2	(0, 2, 2)	1
3	(0, 3, 1)	1
4	(0, 3, 2)	1
5	(0, 3, 3)	2
6	(0, 3, 4)	2
7	(0, 4, 1)	2
8	(0, 4, 2)	2
9	(0, 4, 3)	1
10	(0, 4, 4)	1
11	(0, 5, 1)	1
12	(0, 5, 2)	1
13	(0, 5, 3)	1
14	(0, 5, 4)	1

All the Active Ports available for the task will be listed in this section. You can set the group of the port individually here.

- **No.:** the number of the port.
- **Ports list:** the position information of the port.
- **Group ID:** the number of the group. You can set the **group ID** for each port individually from the scroll down menu.

E. Operation buttons

Reset All to Default

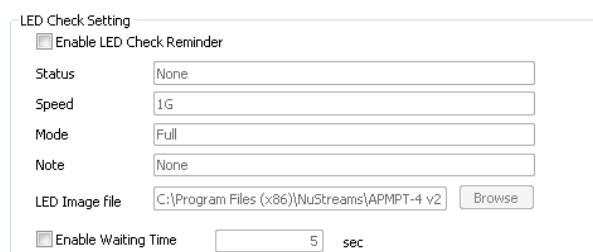

OK

Cancel

- **Reset All to Default:** click this button to reset all the settings in the **MediaType Group Setup** window to default.
- **OK:** click this button to apply all the settings you made in the **MediaType Group Setup** window.
- **Cancel:** click this button to abandon all the settings you made in the **MediaType Group Setup** window.

- **Media Select:** Click the scroll-down menu to choose if all the connecting cables are **Copper** or **Fiber**.
- **Minimum Waiting Time:** APMPT-4 will halt at least for the **Minimum Waiting Time** you input here during auto-negotiation process.
- **Media Type Waiting Timeout:** If the time spent for auto-negotiation exceeds the **Media Type Waiting Timeout** you set here, the test will stop and the test result will be fail.
- **Link up sequentially:** APMPT-4 makes connections to ports sequentially (one-by-one). Therefore, DUT's Link LEDs will be ON in a one-by-one manner as well. If any problems happen during the test, it will be suspended immediately. Users can identify which port is causing the problem by checking DUT's port LEDs.
- **Link Status Check:** APMPT-4 will check all ports in this task are connected properly before test.
- **Reset SFP Module (Fiber Only):** Selecting this function will allow system to turn Off SFP port and then turn On the SFP port.

- **LED Check Setting:** This window can remind the user how DUT LEDs' display should be during the task. The information you set here will be displayed in the **Checking LED Display** window which pops up right after you click the **Start** button on the main window, shown as the picture down below. You can also specify the standing time of the **Checking LED**

LED Check Setting

☐ Enable LED Check Reminder

Status:

Speed:

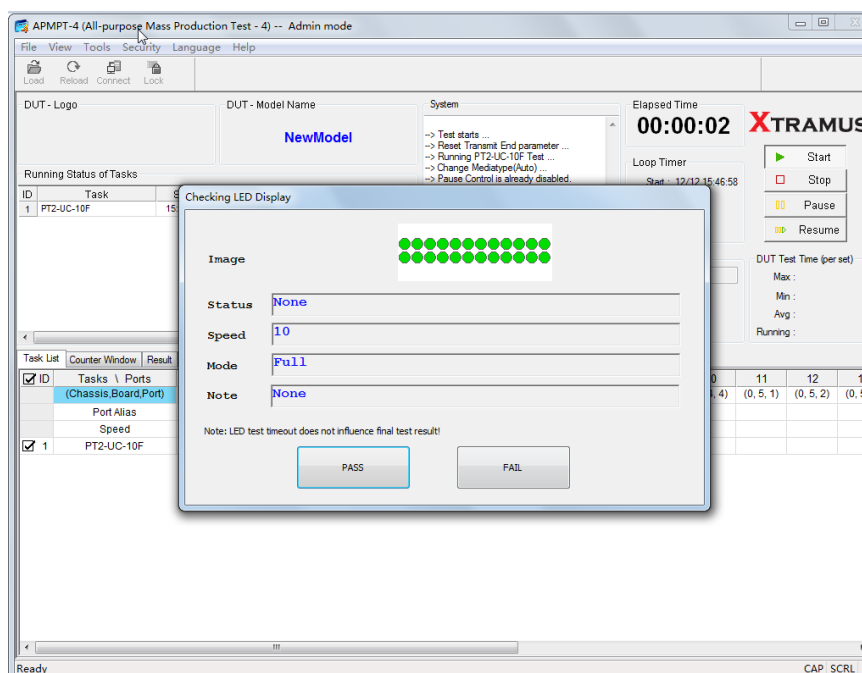

Mode:

Note:

LED Image file:

☐ Enable Waiting Time sec

Display window by checking **Enable waiting time** and inputting its value. During the standing time of **Checking LED Display** window, you can decide and manually operate whether the LED Check test is "Pass" or "Fail" by correspondingly clicking the buttons. If you don't check the **Enable waiting time**, the **Checking LED Display** window will stand permanently until you manually make an operation.

5.2.3. Packet

- **Frame Length Setting:** As shown in the figure down below, in a standard Ethernet II frame, the Frame Length can be from 64~1518 bytes.

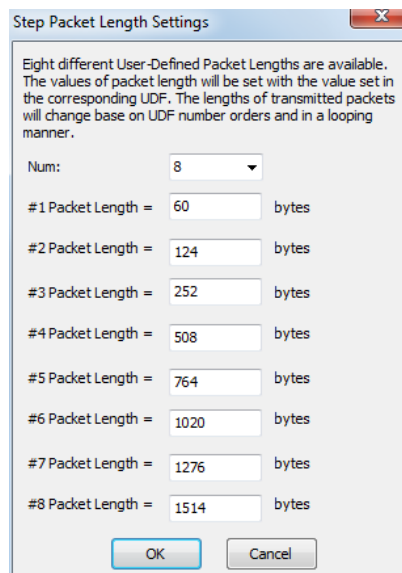

Clicking the **Frame Length** scroll-down menu, you can see four options: **random**, **fixed**, **IMIX**, **Step- Mode**.

Random: the frame length will be randomly assigned from 64 bytes to 1518bytes.

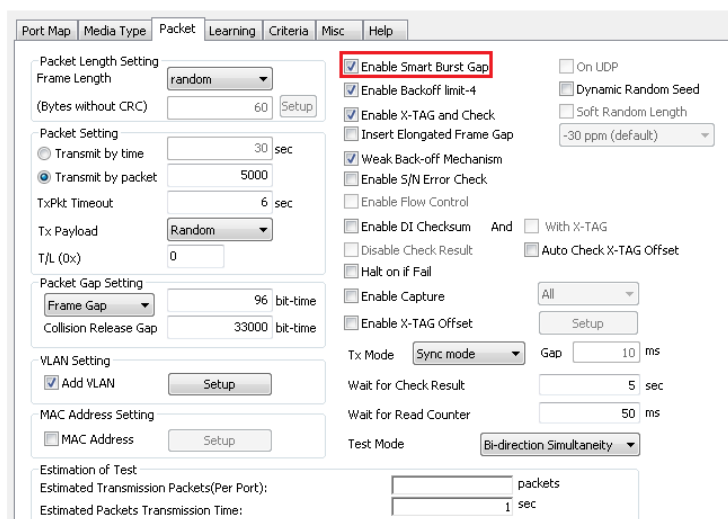

Fixed: the frame length is fixed. The specific value can be set in the field down below.

IMIX: a specific frame length mode, which is “7*64+4*570+1518 bytes”. The packets will be transmitted by this mode cyclically.

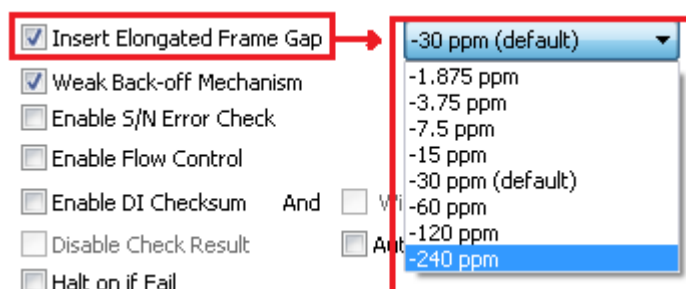

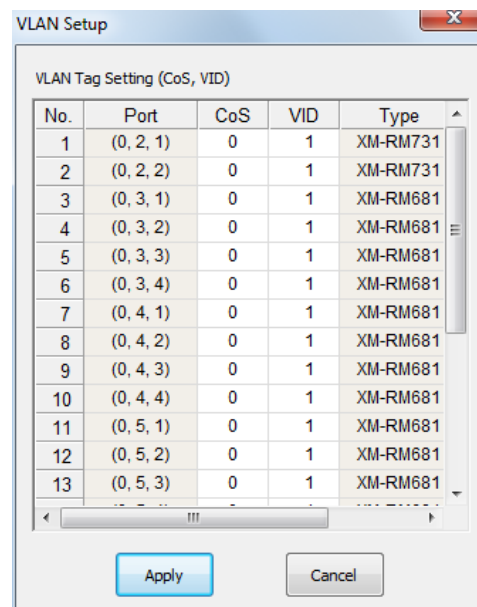

Step-Mode: After choose this mode, please click setup. The “**Step Packet Length Settings**” widow will pop up. You can set at most 8 frame lengths, as shown in the picture down below. The **Num** filed is to be input the number of the frame length. The exact frame length is respectively set from **#1Packet Length** to **#8Packet Length**. The packets will be transmitted by the set frame lengths cyclically.

- **Packet Setting:** You can set how packets will be transmitted in this field.
 - **Transmit by time:** The system will transmit packet during the set amount of time.
 - **Transmit by packet:** The system will transmit the set number of packets. If the system fails to send the test packet within the time you set in **TxPKT Timeout** field, the packet will be drop. Also, you can set the content of the transmitting packets with the **Tx Payload** scroll-down menu.
 - **T/L (0X):** You can set the T/L (0X) after MAC address in this field.
- **Packet Gap Setting:** You can set the gaps between packets in this field.
 - **Frame Gap**
 - Frame Gap: duration time between frames. Increasing Frame Gap reduces the fail rate, while 96 bit-time is wirespeed.
 - Utilization: Click the scroll down menu and select **Utilization**. Then you can set the value of utilization. The Frame Gap and the utilization are tightly related. So once you set one of them, the other is settled as well.
 - **Collision Release Gap:** this function is only available in half duplexing mode. It is used for releasing the collision between the two ends of the communication. You must check the box before the **Enable smart Burst Gap** to make this function effective.

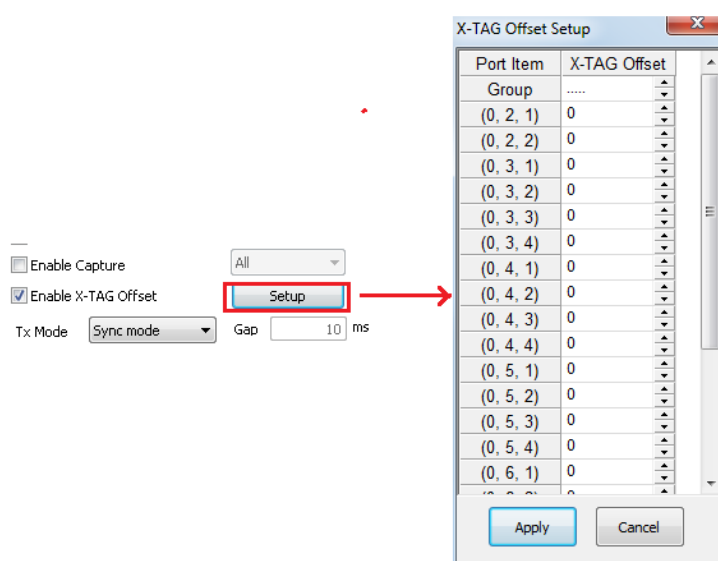

- **VLAN Setting:** Add VLAN tag for test. VLAN (Virtual LAN) is a group of hosts with common requirements that communicate within the same Broadcast domain regardless of the physical location. By clicking the **Setup** button, you can configure **CoS** (class of service) and **VID** (VLAN ID) on the pop-up **VLAN Setup** window. Click **Apply** and apply all the changes you've made here.
- **MAC Address Setting:** Selecting this function will allow you to access the **Setup** option. Clicking the **Setup** option will pop up a window to modify each module card's port **MAC Address**.
- **Enable Smart Burst Gap:** The **Smart Burst Gap** function is for half-duplex mode only. Enabling this function will increase test performance and decrease test fail rate.
- **Enable Backoff limit-4:** The **Backoff limit-4** function is for half-duplex mode only, and its purpose is for collision control. Enabling this function will increase test performance and decrease test fail rate.
- **Enable X-TAG and Check:** X-TAG is a 12-byte tag which is developed by Xtramus and embedded at 45th~56th bytes of each testing frames generated by Rapid-Matrix for multi-stream tests. X-TAG will be added to all the testing frames generated by APMP-4.
- **Insert Elongated Frame Gap:** When enabling this function, 1 bit-time of frame gap will be inserted after a certain amount of packets are **transmitted**, and therefore, decrease packet loss. For XM-RM-8XX modules, you can set the value of the **Insert Elongated Frame Gap** from the scroll down menu.

- **Weak Back-off Mechanism:** When packet collision occurs, the system will wait for at least 1 slot-time before starting to transmit packets again if this function is enabled.
- **Enable S/N Error Check:** APMP-4 will check DUT's serial number during test if this function is enabled.
- **Enable Flow Control:** When enabling this function, the transmitting rate will drop if traffic overflow occurs. This function must be enabled under full-duplex.
- **Enable DI Checksum:** This function is used to track the integrity of a frame. After enable this function, you can choose whether to enable **With X-TAG** and **Auto Check X-TAG offset**.
 - **With X-TAG:** Enable this sub-function only to check the frames with X-TAG.

- **Auto Check X-TAG offset:** Enable this sub-function to automatically check the offset of the X-TAG.
- **Disable Check Result:** When this mode is enabled, all test procedures will be carried out no matter the result is Pass or Fail. This mode can only be access if you choose **Transmit by time** in the **Packet Setting** field.
- **Halt on if Fail:** When this function is enabled, the test process will halt if Fail occurs.
- **Enable Capture:** System will capture all the packets that meet the criteria (**All**, **Error**, **CRC Error**, **Undersize** or **Oversize**) you set on the scroll-down menu on the right side.
- **Enable X-TAG Offset:** If this function is enabled, the position of the X-TAG in the packet will be shifted according to your settings. You can click the **setup** button to pop up the window on the right and you can set the offset of every available port respectively.

- **Tx Mode:** You can change how packet streams will be transmitted. By clicking the **Tx** scroll-down menu, you can choose **Sync Mode**, **Group Mode** (transmitting gap can be set in the **Gap** field located in the right side), and **Sequence Mode**.
- **Wait for check result:** The system will halt for the time you set here before checking test result.
- **Wait for read counter:** The system will halt for the set microseconds before read the counters. This function is useful for counters since they are stored in memory buffer and the final counter value might take some time to read.
- **Test Mode:** The **Test Mode** setting is for half-duplex only. You can set the test mode to **Bi-direction Simultaneity** or **Bi-direction Sequentially**.
- **Estimation of Test:** System will calculate the amount of packets and the time it will take to transmit these packets, and display these statistics in **Estimated Transmission Packets (Per Port)** and **Estimated Packets Transmission Time**.
- **Estimation of Test:** Set the **Estimated Transmission Packets (Per Port)** to evaluate with test result, you can also set the **Estimated Packet Transmission Time** to evaluate with the test result.

- **On UDP:** This function is only available for layer 3 performance task. And before enable this function, you must assign IP addresses to the ports. This function is used to activate the UDP mode in layer 3.
- **Dynamic Random Seed:** If this function is enabled, the first packet transmitted by every port will be random, different from each other. Otherwise, the first packet transmitted by every port will be the same. And this function is only available when the **Frame Length** is set to **random**.
- **Soft Random Length:** This function is only available for XM-RM-881 or XM-RM-891 modules and only can be performed on 10G layer 2 tasks, like PT2-UC-10G. By activating this function, the packet length is limited to fluctuate in a small range when it is set to **random** mode.

The screenshot shows the XTRAMUS configuration interface with several settings highlighted by red boxes:

- Packet Length Setting:** A section containing a dropdown menu for 'Frame Length' set to 'random' and a text input for '(Bytes without CRC)' set to '60'.
- Dynamic Random Seed:** A checkbox that is checked, located in the top right area.
- Soft Random Length:** A checkbox that is checked, located below the Dynamic Random Seed checkbox.
- Packet Setting:** A section on the left with radio buttons for 'Transmit by time' (30 sec) and 'Transmit by packet' (1500000), a 'TxPkt Timeout' of 5 sec, a 'Tx Payload' dropdown set to 'Random', and a 'T/L (0x)' input set to '0'.
- Other Settings:** A list of checkboxes on the right including 'Enable Smart Burst Gap', 'Enable Backoff limit-4', 'Enable X-TAG and Check', 'Insert Elongated Frame Gap', 'Weak Back-off Mechanism', 'Enable S/N Error Check', 'Enable Flow Control', 'Enable DI Checksum', 'Disable Check Result', 'Halt on if Fail', 'On UDP', 'Auto Check X-TAG Offset', and 'With X-TAG'.

5.2.4. Learning

Port Map Media Type Packet Learning Criteria Misc Help

☒ Enable Learning

☒ Broadcast

☐ Unicast

☐ The Same with Testing Packets

Frame Count

Frame Gap bit-time

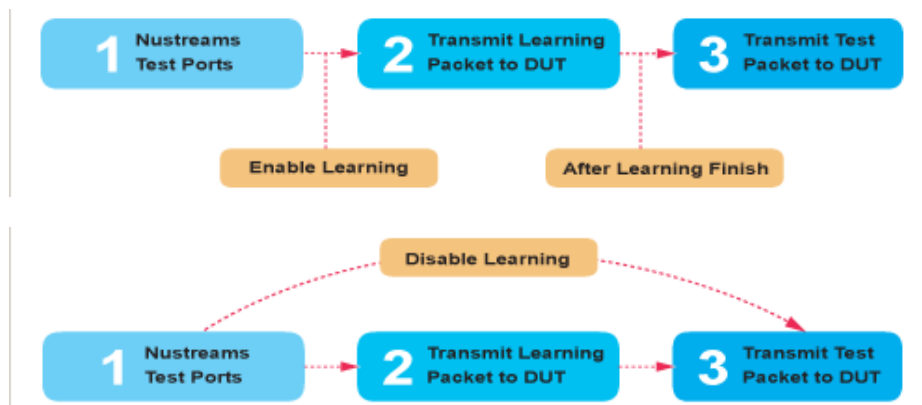

Tx Pkt Timeout sec

Tx Mode

Gap ms.

Delay Time After Learning sec

- **Enable Learning:** As shown in the figures down below, enabling this function allows learning packets transmitted to the DUT before test packets are transmitted. If you disable this function, no learning packets will be transmitted.

- **Broadcast:** Select the learning packet mode for Broadcast.
- **Unicast:** Select the learning packet mode for Unicast.
- **The Same with Testing Packets:** the learning packet mode is the same with that of the Testing Packets.
- **Frame Count:** Repeat frame count per learning packets burst.
- **Frame Gap:** Duration time between learning frames.
- **Tx Pkt Timeout:** If the system fails to send the learning packet within the time you set in **TxPKT Timeout** field, the packet will be drop.
- **Tx Mode:** You can change how learning packet will be transmitted. By clicking the **Tx** scroll-down menu, you can choose **Sync Mode**, **Group Mode** (transmitting gap can be set in the **Gap** field located down below), and **Sequence Mode**.
- **Delay Time After Learning:** The time gap between after learning and the next process.

5.2.5. Criteria

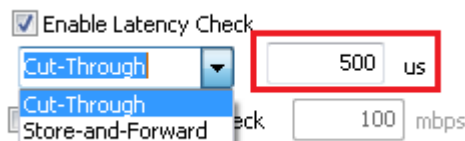

- **Allowable Tolerance:** You can set the allowable amount packet loss/excess here.
 - **Total Packet Loss:** If packet loss (including error packets) is higher then the value you set here, the test result of the DUT will be fail.
 - **Total Packet Excess:** If packets excess (including error packets) is higher then the value you set here, the test result of the DUT will be fail. Packet excess happens when packet transmission is bad and packets are resend multiple times, causing the amount of received packets is more than sent packets.
- **Allowable Lead-in Packet Loss Tolerance:** When enabling this function, APMPT-4 will check the first set amount of transmitted packets (lead-in packets) with the criteria down below. If you enable this function, the **Allowable Tolerance** field will turn gray and unable to access.
 - **Lead-in Packets Number:** Set the amount of lead-in packets.
 - **Lead-in Packet Loss:** Set the allowable amount of lead-in packet loss.
 - **Packet Loss:** Allowable packet loss for the packets sent after lead-in packets.
 - **Packet Excess:** Allowable packet excess for the packets sent after lead-in packets.
- **Collision Event Allowance:** You can set the allowable amount of collisions here.
- **Power Setting:** This function allows you to check DUT's power status during the test. Please note that if there is no power testing module card installed on the chassis, the **Power Setting** section will be gray and thus unable to access.

 - **Enable Power Monitor & Check:** Click this check-box to enable **Power Setting** function. You can set which port on the power testing module card to use by clicking the scroll-down menu.
 - **RMS Voltage/Current, Peak Voltage/Current, and Active Power:** You can set the criteria for power testing in these fields.
- **CRC Tolerance:** the allowable amount of packets with CRC error. If the amount of the received

packets with CRC error is higher than the amount you set here, the test fails. You can set the amount

by two ways: **By Quantity** and **By Percentage** %.

- **Enable Latency Check:** enable the latency check function. There are two optional latency calculation modes, namely **Cut-Through** and **Store-and-Forward**. You can set the acceptable latency in the red rectangle field, shown as the picture down below. If the latency exceeds the value you set here, the test will fail. And this function is unavailable when the **Frame Length** is set to be **random**.

- **Enable line Rate Check:** enable the line rate check function. You can set the lowest line rate in the red rectangle field, shown as the picture down below. If the line rate is lower than the value you set here, the test will fail.

5.2.6. Misc

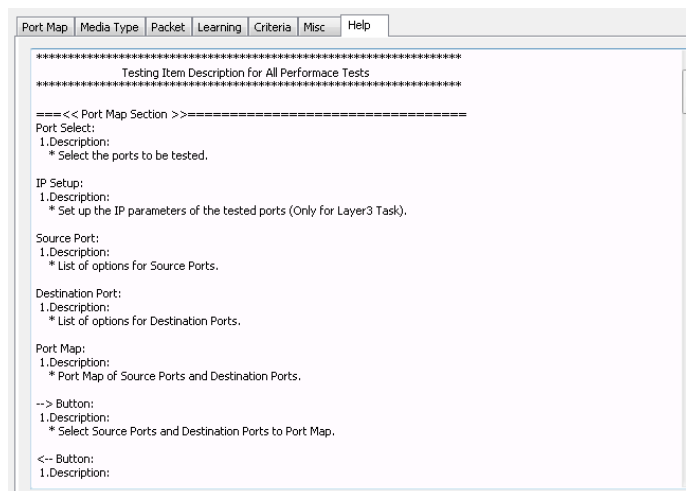

The screenshot shows the 'Misc' tab of a configuration window. At the top is a tab bar with 'Port Map', 'Media Type', 'Packet', 'Learning', 'Criteria', 'Misc', and 'Help'. Below the tabs, there is a 'Title of task name' text box followed by an 'Apply' button. Two checkboxes are present: 'Reduce Tx Power on 10M mode' and 'Pop-up message window before performing next task.'. Below these is a text box for editing the window context, containing the text 'Please click OK to continue.'. Another checkbox, 'Error packet', is located below the text box. A 'Note' box at the bottom states: 'XM-RM600 series modules do not support Reduce Tx Power in 10M Mode.'

- **Title of Task Name:** You can assign a name to this task for identification.
- **Apply:** Apply the changes you made.
- **Reduce Tx Power on 10M Mode:** This option only appears if the transmitting speed of the task is 10M. If this function is enabled, the transmitting speed will be set on 10M. Please note that XM-RM6XX series module cards do not support this function.
- **Pop-up message window before performing next task:** If you enable this function, a message window will pop up after this task is completed. Test will halt until you press the **OK** button on the pop-up window. You can edit the text displayed window to display in the field down below.
- **Error Packet:** This function can only be accessed under APMPT-4's **Demo Mode** and is for demo purposes only. APMPT-4 will generate error packets if this function is enabled.

5.2.7. Help

All test variables used for this task and their definitions will be listed here for reference.

5.3. Test Tasks – Layer 3

For available Layer 3 tasks and their descriptions, please refer to “**1.3.3. Performance Task in Layer 3 (PT3).**”

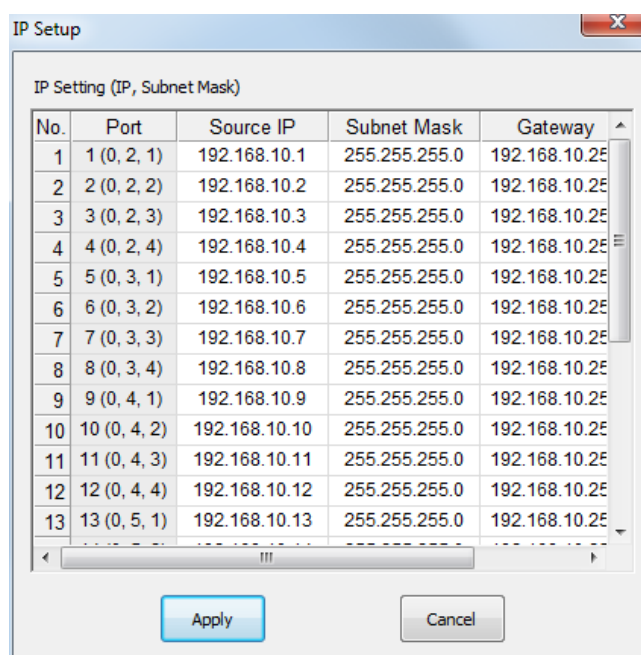

The general task setting options available for Layer 3 Performance Task are almost identical to those available for Layer 2 Performance Task and can be related. However, some features and settings in Layer 2 Performance Task are different from those in Layer 3 Performance Task, which will be listed and explained in the following chapters.

5.3.1. Port Map → IP Setting

As mentioned in “**5.3.1. Port Map**”, the **IP Setup...** button and its function cannot be accessed under Layer 2 Performance Task settings. However, as shown in the figure down below, the **IP Setup** button will be available.

For configure IP addresses under Layer 3 tasks, please click the **IP Setup** button located on **Port Map**. An **IP Setup** window will pop up.

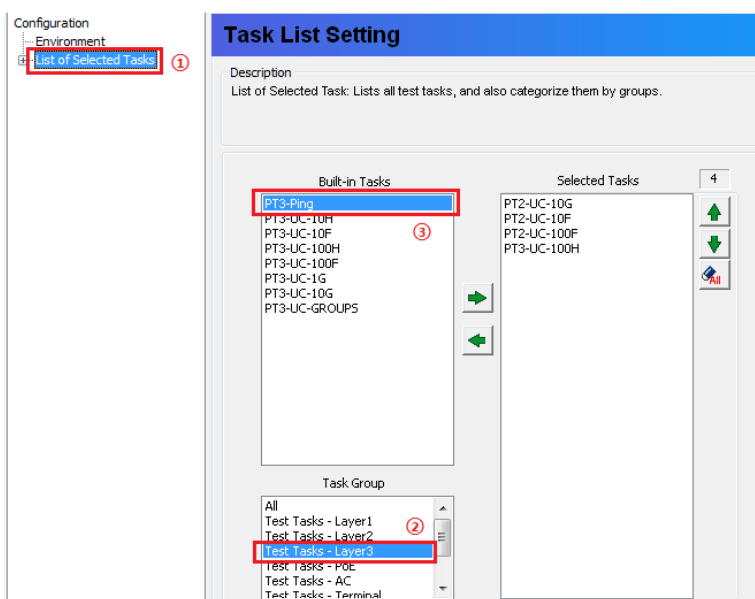

To configure the Source IP, Subnet Mask, and Gateway for each Active Port by double clicking the corresponding column, and input the IP addresses manually.

You can click **Apply** to confirm all the changes you’ve made and close **IP Setup** window, or click **Cancel** to abandon all the changes you’ve made.

5.3.2. Performance Task Layer 3 – PT3-Ping

To access this function, click **List of Selected Tasks**→**Test Tasks-layer3**→**PT3-ping**.

As a network utility, **Ping** is widely used for testing if one specific host is reachable through its IP address. Also, **Ping** can be used to measure the time it takes to transmit packets from a local host to the designated computer located on a network and back.

Setup

No.	Port	IP Address	Subnet Mask	Gateway	Ping IP
1	1 (0, 2, 1)	192.168.10.1	255.255.255.0	192.168.10.254	192.168.10.2
2	2 (0, 2, 2)	192.168.10.2	255.255.255.0	192.168.10.254	192.168.10.1
3	3 (0, 2, 3)	192.168.10.3	255.255.255.0	192.168.10.254	192.168.10.4
4	4 (0, 2, 4)	192.168.10.4	255.255.255.0	192.168.10.254	192.168.10.3
5	5 (0, 3, 1)	192.168.10.5	255.255.255.0	192.168.10.254	192.168.10.6
6	6 (0, 3, 2)	192.168.10.6	255.255.255.0	192.168.10.254	192.168.10.5

Port Select ...

Ping Count: 4

MediaType: OFF

Auto DIP Setup: Select ...

Ping Interval: 1 sec

Waiting Time: 20 sec

Reset Default: Select ...

Wait for Check Result: 0 sec

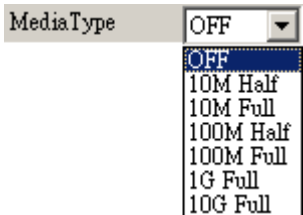

Link Status Check: ON

- **IP Address Table:** Since **Ping** is a network utility based on TCP/IP protocol, you must assign IP addresses to all the Active Ports first on the **IP Address Table**.

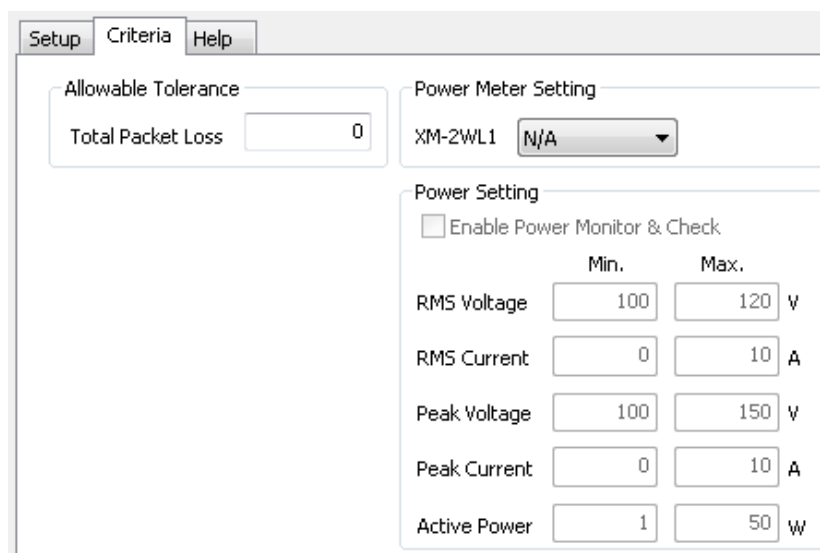

No.	Port	IP Address	Subnet Mask	Gateway	Ping IP
1	1 (0, 2, 1)	192.168.10.1	255.255.255.0	192.168.10.254	192.168.10.2

Take the figure above as an example: the Active Port (0, 2, 1) will be assigned an IP Address (192.168.10.1), a Subnet Mask (255.255.255.0), and a Gateway (192.168.1.254). This Active Port will **ping** the IP address of 192.168.10.2 during the test. All the IP addresses, Subnet Mask, Gateway,

and Ping IP can be set by double clicking on the column and input manually.

- **Port Select:** By clicking this button, a **Select Ports for Testing** window will pop up, allowing you to select the module cards and the ports you would like to use for the task.
- **Auto DIP (Destination IP) Setup:** You can select whether to import **Pair Port IP** or **Rotate Port IP** and apply it for **Ping** test.
 - **Pair Port IP → Ping IP:** Ports located on the same module card are paired together.
 - **Rotate Port IP → Ping IP:** All ports located on different module cards are paired in a loop manner.
- **Reset Default:** Set the current setting to **Pair Port IP → Ping IP** or **Rotate Port IP → Ping IP** with default setting values.
- **Ping Count:** You can set how many times the **Ping** will be run in this field.
- **Ping Interval:** You can set the interval between each **Ping** in this field.
- **Wait for Check Result:** The system will halt for the set amount of time before checking the result.
- **Media Type:** Click this scroll-down menu to select the media type for Ping test. If you do not want to make any changes, please select **OFF**.
 
- **Waiting Time:** You can set the amount of waiting time after the media type is changed in this field. This function will turn gray and can't be accessed if you select **OFF** under **Media Type**.
- **Link Status Check:** Check link status before test. If you select **ON&Alarm**, an alarm window will pop-up if link fails. And if the Media Type is set to be OFF, this function is unable to use.

Criteria

The screenshot shows the 'Criteria' tab in the software interface. It contains three main sections:

- Allowable Tolerance:** A text box for 'Total Packet Loss' with the value '0'.
- Power Meter Setting:** A dropdown menu showing 'XM-2WL1' and 'N/A'.
- Power Setting:** A section with a checkbox 'Enable Power Monitor & Check' and a table of power parameters:

	Min.	Max.	
RMS Voltage	100	120	V
RMS Current	0	10	A
Peak Voltage	100	150	V
Peak Current	0	10	A
Active Power	1	50	W

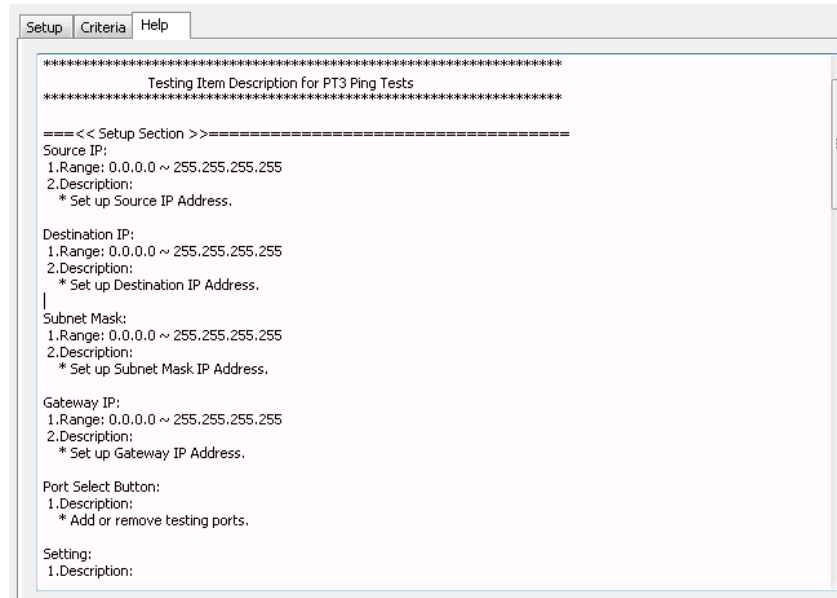

- **Allowable Tolerance:** You can set the allowable amount packet loss/excess here.
 - **Total Packet Loss:** If packet loss (including error packets) is higher than the value you set here, the test result of the DUT will be fail.
- **Power Setting:** This function allows you to check DUT's power status during the test. Please note that if there is no power testing module card installed on the chassis, the **Power Setting** section will

be gray and thus unable to access.

- **Enable Power Monitor & Check:** Click this check-box to enable **Power Setting** function. You can set which port on the power testing module card to use by clicking the scroll-down menu.
- **RMS Voltage/Current, Peak Voltage/Current, and Active Power:** You can set the criteria for power testing in these fields.

Help

All test variables used for this task and their definitions will be listed here for reference.

5.4. Test Task – PoE

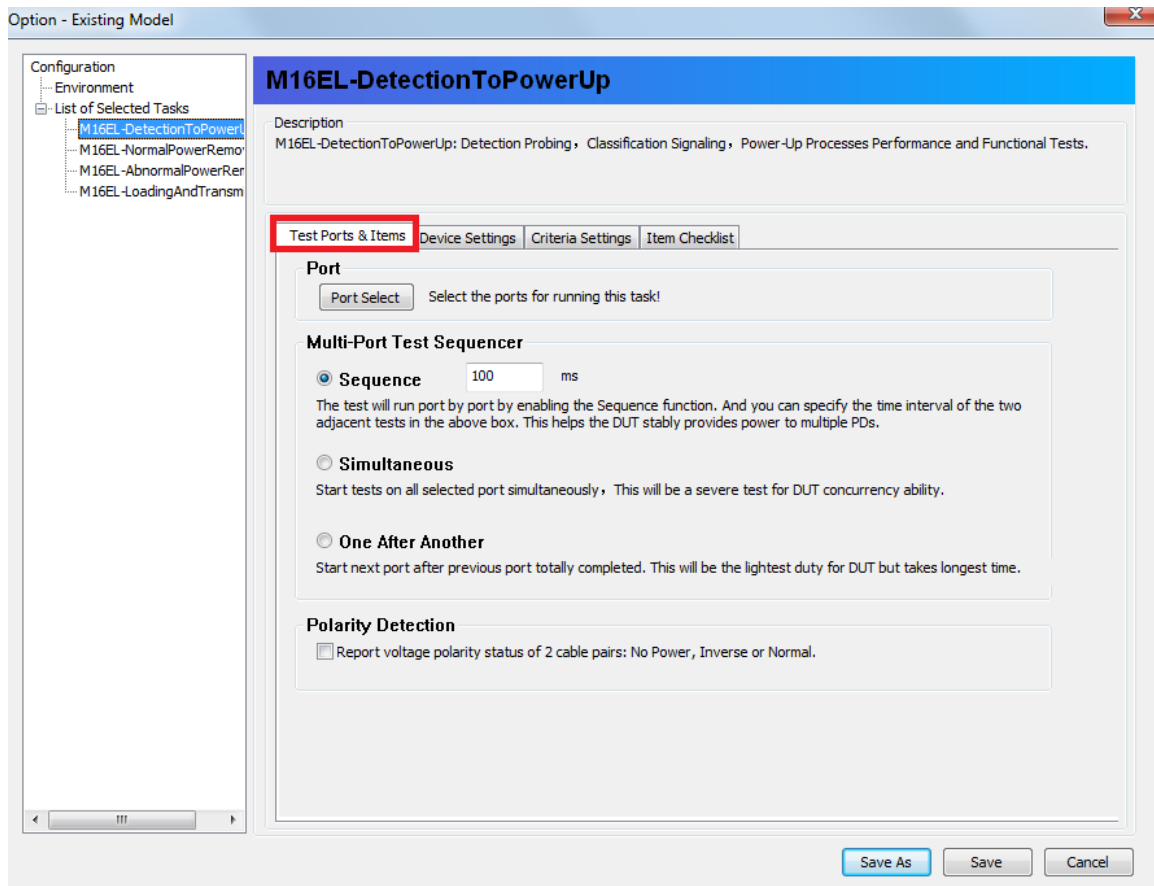

PoE refers to **Power over Ethernet**. APMPT-4 allows you to perform PoE tests such as:

Types of PoE's Task	
M16EL-DetectionToPowerUp	Test the PSE's performance during the process from detection to power up, including detection, classification and power up, etc.,.
M16EL-NormalPowerRemoval	Test the PSE's power removal ability when the powered device (PD) is disconnected.
M16EL-AbnormalPowerRemoval	Test the PSE's power removal ability when Overload, Short circuit, Underload happens to the PD.
M16EL-LoadingAndTransmmision	Test the PSE's PoE and data transmission ability concurrently.

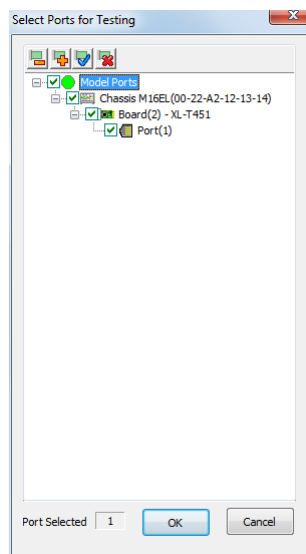

To execute the PoE tasks listed above, you must have a NuPOE-16EL chassis platform installed on your worksite. For more information about NuPOE-16EL and its modules, please see "USM_NuPOE-16EL".

5.4.1. M16EL-DetectionToPowerUp

A. Test Ports & Items

- **Port Select:** Select the ports for running this task. Click this button, the following window pops up. Click **OK** to make the settings be applied.

- **Multi-Port Test Sequencer:** sequence control when multi ports are assigned to perform this test.
 - **Sequence:** the test will run port by port by enabling this function. You can specify the time

interval for the test executing on the adjacent ports in the above box. This helps the DUT to power the PDs stably.

- **Simultaneously:** The selected ports will execute this task simultaneously.
 - **One After Another:** The selected ports will execute this task one after another. Namely, the task is executed on the next port until it is fully executed on the previous one. This generates less pressure for the DUT.
- **Polarity Detection:** Report voltage polarity of 2 cable pairs: No power, Inverse or Normal.

Default Apply

- **PSE Description/Mode:**

- **PSE Description/Mode:** Select the PSE mode according to the PSE's real situation.
- **Power Range:** Select the maximum power the PSE can supply according to the PSE's real situation.

- **Class**

Select the PD classification. In the NuPOE-M16EL test platform, the PD is simulated by the XL-T451 module. XL-T451 supports both 802.3af and 802.3at. The maximum power input for XL-T451 is 45W.

Class	Power range (Watt)
0	0.44 to 12.95
1	0.44 to 3.84
2	3.84 to 6.49
3	6.49 to 12.95
4	802.3af: Reserved
	802.3at : ≥ 12.95

- **PSE To T451 Cable Status**

- **Cable Select:** Select the cable category you are using.
- **Cable Length:** Select the length of the cable.

- **Alternative**

Select the power supply wire pairs of the PSE.

- **Alt-A(12, 36):**The PSE uses wire pairs 12, 36 as the power pairs.
- **Alt-A(45, 78):** The PSE uses wire pairs 45, 78 as the power pairs.
- **Both:** The PSE can use either wire pairs 12, 36 or 45, 78 as the power pairs.

RJ45 Pin #	Wire Color (T568A)	Wire Diagram (T568A)	10Base-T Signal 100Base-TX Signal	PoE
1	White/Green		Transmit+	Mode A +
2	Green		Transmit-	Mode A +
3	White/Orange		Receive+	Mode A -
4	Blue		Unused	Mode B +
5	White/Blue		Unused	Mode B +
6	Orange		Receive-	Mode A -
7	White/Brown		Unused	Mode B -
8	Brown		Unused	Mode B -

- **Enable LLDP**

By enabling LLDP, the PD can negotiate power with the PSE through the LLDP protocols.

- **Enable 802.3 Power via MDI:** Support LLDP.
- **Enable Extended Power via MDI:** Support LLDP-MED.
- **Message Tx Interval:** Transmitting time interval between two LLDP packets.
- **LLDP Report Loading:** The reported power of PD to PSE carried by the LLDP packets.

C. Criteria Settings:

The screenshot shows the 'M16EL-DetectionToPowerUp' configuration window. The 'Criteria Settings' tab is selected and highlighted with a red box. The window has a description at the top: 'M16EL-DetectionToPowerUp: Detection Probing, Classification Signaling, Power-Up Processes Performance and Functional Tests.' Below the description are four tabs: 'Test Ports & Items', 'Device Settings', 'Criteria Settings', and 'Item Checklist'. The 'Criteria Settings' tab contains two sections: 'Miscellaneous' and 'Timeout'. The 'Miscellaneous' section has an 'Overheat Threshold' set to 70 °C. The 'Timeout' section has two parameters: 'Interval from connect to loading' set to 1000 ms and 'Power Up Timeout' set to 10000 ms. At the bottom right of the window are 'Default' and 'Apply' buttons.

M16EL-DetectionToPowerUp

Description
M16EL-DetectionToPowerUp: Detection Probing, Classification Signaling, Power-Up Processes Performance and Functional Tests.

Test Ports & Items | Device Settings | **Criteria Settings** | Item Checklist

1 (IP192.168.1.58, 02)

Miscellaneous
Overheat Threshold 70 °C

Timeout
Interval from connect to loading 1000 ms
Power Up Timeout 10000 ms

Default Apply

- **Overheat Threshold:** This is for safety. If the system temperature exceeds the value you specified here, the system will send out alarms.
- **Timeout**
Timeout parameters for this task. You can set any of the timeout parameters as required. If any of these timeouts occurs, the test will be terminated and fail.

☐ **Simultaneous**
 Start tests on all selected port simultaneously. This will be a severe test for DUT concurrency ability.

☐ **One After Another**
 Start next port after previous port totally completed. This will be the lightest duty for DUT but takes longest time.

Packet Transmit
☐ Enable packet transmit during PoE loading. This function needs assistance of XM/RM modules.

- **Port Select:** Select the ports for running this task. Click this button, the following window pops up. Click **OK** to make the settings be applied.

- **Multi-Port Test Sequencer:** sequence control when multi ports are assigned to perform this test.
 - **Sequence:** the test will run port by port by enabling this function. You can specify the time interval for the test executing on the adjacent ports in the above box. This helps the DUT to power the PDs stably.
 - **Simultaneously:** The selected ports will execute this task simultaneously.
 - **One After Another:** The selected ports will execute this task one after another. Namely, the

task is executed on the next port until it is fully executed on the previous one. This generates less pressure for the DUT.

- **Packet Transmit:** If this function is enabled, you can do the PoE tests and traffic testing concurrently. But you need to have the NuPOE-16EL platform and the Nustreams Platform installed at the same time.

B. Device Settings

M16EL-LoadingAndTransmission

Description
M16EL-LoadingAndTransmission: Fully Adjustable Dynamic Multi Level Loading Sequence Performance and Analog Measurement.

Test Ports & Items | **Device Settings** | Criteria Settings | Dynamic Loading Stages/Steps

1 (IP 192.168.1.58, 02)

PSE Description/Mode
PSE Type: ☒ Endspan ☐ Midspan
Power Range: ☒ 15.4W ☐ 30W ☐ 45W ☐ Unknown

Class
☒ Class 0 ☐ Class 1 ☐ Class 2 ☐ Class 3 ☐ Class 4

PSE to T451 Cable Status
Cable Select: ☐ Cat-3 ☒ Cat-5 ☐ Cat-7 ☐ Cat-7A
Length(M):
Alternative: ☒ Alt-A(1236) ☐ Alt-B(4578) ☐ Both

☐ **Enable LLDP**
☐ Enable 802.3 Power via MDI
☒ Enable Extended Power via MDI
Message Tx Interval: sec
LLDP Report Loading: W

Default Apply

- **PSE Description/Mode:**

- **PSE Description/Mode:** Select the PSE mode according to the PSE's real situation.
- **Power Range:** Select the maximum power the PSE can supply according to the PSE's real situation.

- **Class**

Select the PD classification. In the NuPOE-M16EL test platform, the PD is simulated by the XL-T451 module. XL-T451 supports both 802.3af and 802.3at. The maximum power input for XL-T451 is 45W.

Class	Power range (Watt)
0	0.44 to 12.95
1	0.44 to 3.84
2	3.84 to 6.49
3	6.49 to 12.95
4	802.3af: Reserved
	802.3at : ≥ 12.95

- **PSE To T451 Cable Status**

- **Cable Select:** Select the cable category you are using.
- **Cable Length:** Select the length of the cable.

- **Alternative**

Select the power supply wire pairs of the PSE.

- **Alt-A(12, 36):**The PSE uses wire pairs 12, 36 as the power pairs.
- **Alt-A(45, 78):** The PSE uses wire pairs 45, 78 as the power pairs.
- **Both:** The PSE can use either wire pairs 12, 36 or 45, 78 as the power pairs.

RJ45 Pin #	Wire Color (T568A)	Wire Diagram (T568A)	10Base-T Signal 100Base-TX Signal	PoE
1	White/Green		Transmit+	Mode A +
2	Green		Transmit-	Mode A +
3	White/Orange		Receive+	Mode A -
4	Blue		Unused	Mode B +
5	White/Blue		Unused	Mode B +
6	Orange		Receive-	Mode A -
7	White/Brown		Unused	Mode B -
8	Brown		Unused	Mode B -

- **Enable LLDP**

By enabling LLDP, the PD can negotiate power with the PSE through the LLDP protocols.

- **Enable 802.3 Power via MDI:** Support LLDP.
- **Enable Extended Power via MDI:** Support LLDP-MED.
- **Message Tx Interval:** Transmitting time interval between two LLDP packets.
- **LLDP Report Loading:** The reported power of PD to PSE carried by the LLDP packets.

C. Criteria Settings:

The screenshot shows the 'M16EL-LoadingAndTransmission' configuration window. The 'Criteria Settings' tab is selected and highlighted with a red box. The window contains a description, a list of test ports/items, and configuration fields for 'Miscellaneous' and 'Timeout'.

M16EL-LoadingAndTransmission

Description
M16EL-LoadingAndTransmission: Fully Adjustable Dynamic Multi Level Loading Sequence Performance and Analog Measurement.

Test Ports & Items | Device Settings | **Criteria Settings** | Dynamic Loading Stages/Steps

1 (IP 192.168.1.58, 02)

Miscellaneous
Overheat Threshold 70 °C

Timeout
Interval from connect to loading 1000 ms
Power Up Timeout 10000 ms

Default Apply

- **Overheat Threshold:** This is for safety. If the system temperature exceeds the value you specified here, the system will send out alarms.
- **Timeout**
Timeout parameters for this task. You can set any of the timeout parameters as required. If any of these timeouts occurs, the test will be terminated and fail.

D. Dynamic Loading Stages/Steps

M16EL-LoadingAndTransmission

5.5. Test Task – AC

Test Task – AC allows you to test DUT's power supply. For more detail description regarding to Test Task – AC, please refer to “1.3.5. AC Test”. Please note that if you don't have XM-2WL1 module card installed on your chassis, you can't run tasks mentioned here.

5.5.1. PWR-Setup (Power Setup Test)

With module card XM-2WL1 providing power to the DUT, you can perform power ON/OFF and cycling tests with PWR-Setup.

Setup

- **Power Control:** To turn the power of DUT **ON** or **OFF**.
- **Zero/Peak Cross:** In a Voltage vs. Time diagram shown on the right, a Zero Cross happens every time when the value of voltage reaches zero. Zero-crossing is the key to determining the proper switching time (phase angle) in both leading edge and trailing edge dimmers. You can set the crossing mode to **0** to **270** degrees here, or you can set the crossing mode to **Free-run** mode.
- **Cycle Setting:** By click the **Enable Cycle Reboot** check-box, you can perform power on/off cycling tests.
 - **Initial/End:** You can set the starting/ending power status to **ON/OFF** here in these fields.
 - **Count:** You can set how many times you would like to run the power on/off cycling test.
 - **Interval:** You can set the amount of seconds system shall wait between each cycling test.
- **Wait before Power ON/OFF:** System will halt for the set amount of seconds before power on/off.
- **Wait after Power ON/OFF:** System will halt for the set amount of seconds after power on/off.

- **Port Select:** By clicking this button, a **Select Ports for Testing** window will pop up, allowing you to select the module cards and the ports you would like to use for the task.
- **Test Period:** The period of time for the power on/off cycling you set will be displayed in this column.
- **Halt on if Fail:** If you enable this function, system will stop if the test fails.

Criteria

	Min.	Max.	
RMS Voltage	0	0	V
RMS Current	0	0	A
Peak Voltage	0	0	V
Peak Current	0	0	A
Active Power	0	0	W

The **Criteria** serves no functions under **PWR-Setup** task, and therefore cannot be accessed.

Misc

Title of task name

- **Title of task name:** You can assign a name to this task for identification.
- **Apply:** Apply the changes you made.

Help

5.6. Test Task – Terminal

This task contains two subtasks: **Console** and **Telnet**. For more detail description regarding to this task , please refer to “1.3.6. Terminal Test”.

5.6.1. Console

Setup

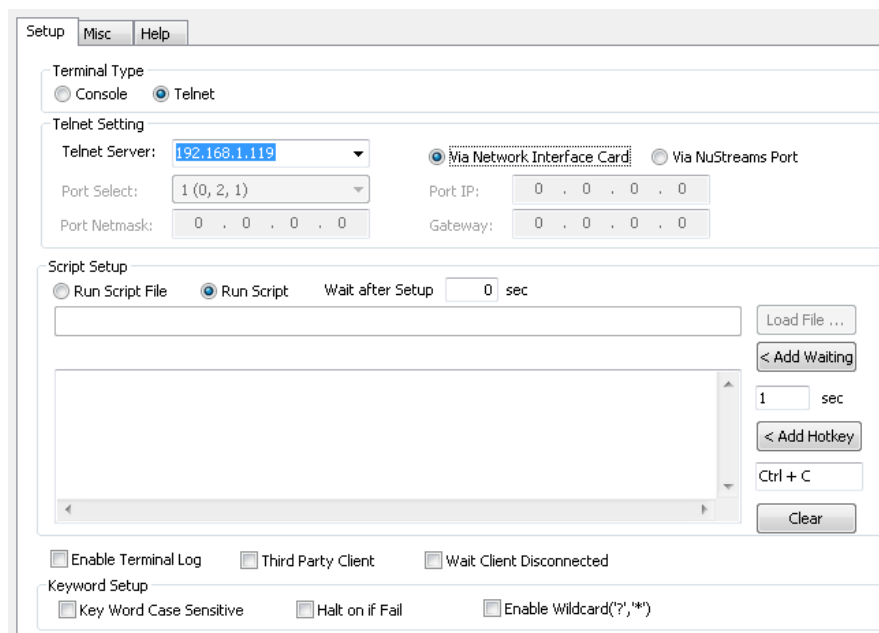

- **Console Setting:** This table shows information regarding to the testing serial port.
 - **Port:** COM port of the IPC or the PC that control the chassis
 - **Baud Rate:** Transmission speed.
 - **Data Bits:** Data length of a segment.
 - **Stop Bits:** Stop bits of a segment
 - **Parity:** The method to check the correctness
 - **Flow:** Set the type of flow control based on **Xon/Xoff**, **Hardware** or **None**.
 - **Default:** Click **Default** to set all values to default.
- **Script Setup:** To execute scripts for serial port tests, you can choose to **Run Script File**, or **Run Script**.
 - **Run Script File:** Click **Load File** to load a text file (*.txt) on your PC.

- **Run Script:** You can edit/input a script with console commands in the field down below. Click **< Add Waiting** to add a waiting command to the edit area. You can set the amount of seconds for the waiting command in the field down below. To clear all texts in the edit area, click **Clear**.

- **Wait after Setup:** You can set the waiting time for the system to halt after finishing configuring.
- **Add a Hotkey:** You can indicate a command as hotkey for script between Ctrl+A to Ctrl+Z.
- **Enable Terminal Log:** You can choose whether to print the contents transmitted by the COM or Telnet into the executing log by tests.
- **Third party Client:** You can check this function to make the third party software as the visual interaction window. APMP4 will function as an transfer station (virtual Telnet server), which will feedback the communication details between COM or Telnet and DUT to the third party software interfaces via Telnet protocols , receive the manual input commands by the third party users via Telnet and forward the commands to the DUT via Telnet or COM.
- **Wait Client Disconnected:** When checking this function, the user can interact with the DUT after executing the scripts by manually inputting commands before closing the window and exiting the task. Or the task will be exited directly after executing the scripts.
- **Keyword setup:** This table shows information regarding to the scripts.
 - **Key Word Case Sensitive:** Decide whether the script is case sensitive.
 - **Halt on if Fail:** Decide whether to ignore other tasks and exit the task when error happens.
 - **Enable Wildcard ('?', '*'):** Decide whether to support wildcard.

5.6.2. Telnet Setup

- **Telnet Setting:** This function provides IP settings for the DUT to normally communicate with the DUT. There are two modes: **Via Network Interface Card** and **Via NuStream Port**.
 - **Via Network Interface Card:** Under this mode, the NIC of the host running APMP4 will connect

with the DUT via network. The IP and route settings of the NIC should be correctly configured to ensure the normal network communications with the Telnet Server.

- **Via NuStream Port:** Under this mode, the module installed in NuStreams-600i chassis will connect with the DUT via network. The IP and route settings of the port should be correctly configured to ensure the normal network communications with the Telnet Server. You can choose the port that will be connected with the DUT through **Port Select**. And you can set the **Port IP**, **Port Netmask**, **Gateway** to communicate with the DUT.
- **Script Setup:** To execute scripts for serial port tests, you can choose to **Run Script File**, or **Run Script**.
 - **Run Script File:** Click **Load File** to load a text file (*.txt) on your PC.

The screenshot shows the 'Script Setup' window. At the top, there are two radio buttons: 'Run Script File' (which is selected) and 'Run Script'. To the right of these is a 'Wait after Setup' field set to '0 sec'. Below the radio buttons is a large text input area. To the right of the text input area is a button labeled 'Load File ...' which is highlighted with a red rectangular box. Below the 'Load File ...' button is another button labeled '< Add Waiting'.

- **Run Script:** You can edit/input a script with console commands in the field down below. Click **< Add Waiting** to add a waiting command to the edit area. You can set the amount of seconds for the waiting command in the field down below. To clear all texts in the edit area, click **Clear**.

This screenshot is similar to the previous one, but the 'Run Script' radio button is now selected. The 'Load File ...' button is still present. The '< Add Waiting' button, located below the 'Load File ...' button, is now highlighted with a red rectangular box.

- **Wait after Setup:** You can set the waiting time for the system to halt after finishing configuring.
- **Add Hotkey:** You can indicate a command as hotkey for script between Ctrl+A to Ctrl+Z.
- **Clear:** clear the contents you input in the text box.
- **Enable Terminal Log:** You can choose whether to print the contents transmitted by the COM or Telnet into the executing log by tests.
- **Third party Client:** You can check this function to make the third party software as the visual interaction window. APMP4 will function as an transfer station (virtual Telnet server), which will feedback the communication details between COM or Telnet and DUT to the third party software interfaces via Telnet protocols , receive the manual input commands by the third party users via Telnet and forward the commands to the DUT via Telnet or COM.
- **Wait Client Disconnected:** When checking this function, the user can interact with the DUT after executing the scripts by manually inputting commands before closing the window and exiting the task. Or the task will be exited directly after executing the scripts.
- **Keyword setup:** This table shows information regarding to the scripts.
 - **Key Word Case Sensitive:** Decide whether the script is case sensitive.
 - **Halt on if Fail:** Decide whether to ignore other tasks and exit the task when error happens.
 - **Enable Wildcard ('?', '*'):** Decide whether to support wildcard.

- * 7 : Select Data Bits at 7.

5.7. Test Tasks – General

Tasks available here include **Toggle MDI-II/X**, **Media Pre-Setting**, **1 to Many-UC**, **1 to Many-MCV**, **Inserting Waiting Time**, **CALL-EXT** and **LineEmulate**.

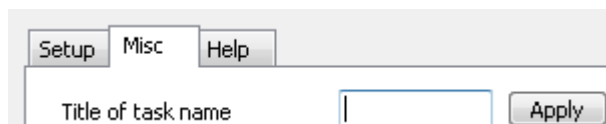

5.7.1. Toggle MDI-II/X

Test the Auto MDIX function of different speed/link modes of the DUT. Toggle MDI-II/X is a technology that automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately.

Setup

- **Media Type Select:** Click the scroll-down menu to select the media type.
- **Minimum Waiting Time:** APMPT-4 will halt at least for the **Minimum Waiting Time** you input here during auto-negotiation process.
- **Media Type Waiting Timeout:** If the time spent for auto-negotiation exceeds the **Media Type Waiting Timeout** you set here, the test will stop and the test result will be fail.
- **Reduce Tx Power on 10M Mode:** If this function is enabled, the transmitting speed will be set on 10M. Please note that XM-RM600 series module cards do not support this function.
- **Port Select:** By clicking this button, a **Select Ports for Testing** window will pop up, allowing you to select the module cards and the ports you would like to use for the task.

Misc

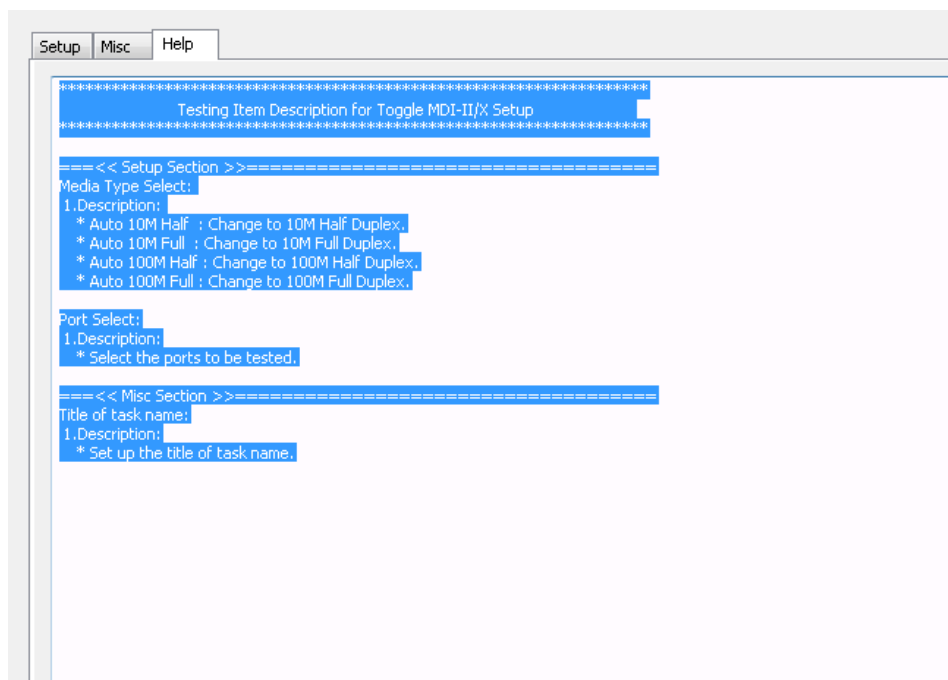

The screenshot shows the 'Misc' tab of a software window. It contains a label 'Title of task name' followed by a text input field and an 'Apply' button.

- **Title of task name:** You can assign a name to this task for identification.
- **Apply:** Apply the changes you made.

Help

All test variables used for this task and their definitions will be listed here for reference.

The screenshot shows the 'Help' tab of the software window. It displays a structured list of test variables and their definitions, organized into sections. The text is as follows:

```

1.Description:
* Set up the title of task name.
```

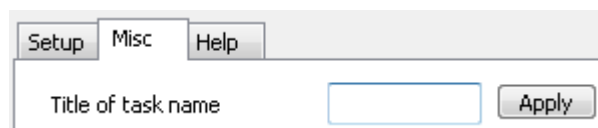

5.7.2. Media Pre-Setting

Test MDIX by Media Pre-setting mode or force MDI (straight-through connection) or MDIX (crossover connection) mode of DUT.

Setup

- **Type Select:** Click the scroll-down menu to choose the link mode for Media Pre-Setting test. Three modes are available: **Auto MDI-X**, **Force MDI**, and **Force MDIX**. Please note that since XM-RM600 series module cards do not support Force MDI-X, all XM-RM6XX modules will be tested under Force MDI-II mode instead.
- **Waiting Time:** APMP-4 will halt at least for the **Waiting Time** you input here during test process.
- **Halt on if Fail:** If you enable this function, system will stop if the test fails.
- **Port Select:** By clicking this button, a **Select Ports for Testing** window will pop up, allowing you to select the module cards and the ports you would like to use for the task.

5.7.3. 1 to Many-UC

1 to Many-UC is a Unicast Full Performance Test. Performing Layer 2 MAC address Unicast performance tests from one source to multiple ports with different media types (such as 100Mbps and 1Gbps Full).

Please note that **1 to Many-UC** can only be run alone without other tasks in the **Selected Task List**.

Port Map

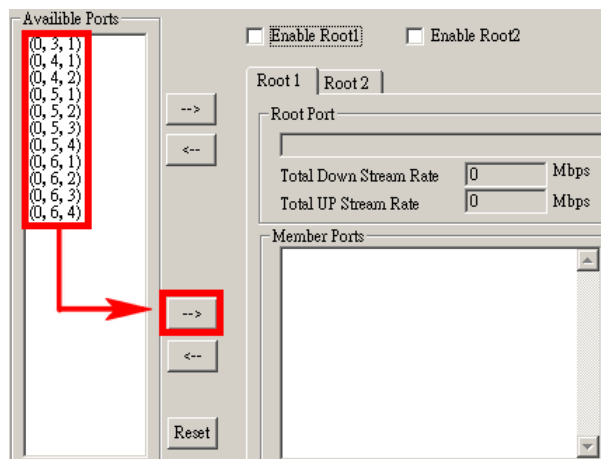

Before making any other configurations for **1 to Many-UC** test, you have to assign a **Root Port** and its **Member Ports** for **Root 1** or **Root 2** first. Please note that only Active Ports from module cards **XM-RM731** and **XM-RM891** can serve as **Root Ports**.

To assign an Active Port as the Root Port for Root 1 or Root 2, please click the Active Port you would like to use as a Root Port, and then click the → button to add it to the Root Port field located on the right side. To remove the Root Port you've assigned, click the ← button.

To assign Active Ports as the Member Ports for Root 1 or Root 2, please click the Active Ports you would like to use as Member Ports, and then click the → button to add it to the member Ports field located on the right side. To remove a Member Port you've assigned, click the Member Port you would like to remove, and then click the ← button.

- **Available Ports:** All available Active Ports will be shown in this field. If you assign an Active Port as the Root Port or one of the Member Ports, it will be removed from this field.
- **→/←:** You can add an selected Active Port as the Root Port or one of the Member Ports by clicking the → button, or remove the Root Port or Member Ports by clicking the ← button.
- **Reset:** Click this button to remove all Active Ports that has been assigned as Root Port or Member Ports.
- **Enable Root 1/2:** Click these check boxes to select which Root you would like to use for 1 to Many-UC test.
- **Root 1/Root2:** Click these tabs to choose which Root you would like to view/configure.

Quick Setup									

You can make **Up Stream** and **Down Stream** packet transmitting settings for all the Active Ports that's used for **1 to Many-UC** test here. The configuration for **Traffic Port 1** and **Traffic Port 2** are identical, and can be related.

You can configure all the settings for each Active Port listed in **Up Stream** or **Down Stream** field in a one-by-one manner by double-clicking the column you would like to configure.

You can also click the **Quick Setup** button. A **Quick Setup** window will pop up. The settings you made here will apply to all the Active Ports listed in the **Up Stream** or **Down Stream** field.

Test Procedure

- **Learning Setting:**
 - **Enable Learning:** Enabling this function allows learning packets transmitted to the DUT before test packets are transmitted. If you disable this function, no learning packets will be transmitted.
 - **Broadcast:** Select the learning packet mode for Broadcast mode.
 - **Unicast:** Select the learning packet mode for Unicast mode.
 - **The Same with Testing Packets:** The learning packet mode will be the same as the **Testing Packets** settings.
 - **Frame Count:** Repeat frame count per learning packets burst.
 - **Frame Gap:** Duration time between learning frames.
 - **Tx Pkt Timeout:** If the system fails to send the learning packet within the time you set in **TxPKT Timeout** field, the packet will be drop.
 - **Tx Mode:** You can change how learning packet will be transmitted. By clicking the **Tx** scroll-down menu, you can choose **Sync Mode**, **Group Mode** (transmitting gap can be set in the **Gap** field located down below), and **Sequence Mode**.
 - **Delay Time After Learning:** The time gap between after learning and the next process.
- **Media Type Setting:**
 - **Minimum Waiting Time:** APMP-4 will halt at least for the **Minimum Waiting Time** you input here during auto-negotiation process.
 - **Media Type Waiting Timeout:** If the time spent for auto-negotiation exceeds the **Media Type Waiting Timeout** you set here, the test will stop and the test result will be fail.
- **Capped Mode (limit loop count):** Selecting this function will allow packets to be transmitted by sequence.
- **Weak Back-off Mechanism:** When packet collision occurs, the system will wait for at least 1

slot-time before starting to transmit packets again if this function is enabled.

- **Reset SFP Module (Fiber Only):** Selecting this function will allow system to turn Off SFP port and then turn On the SFP port.
- **Enable S/N Error Check:** Selecting this option will enable the capturing of S/N Error.
- **Insert Elongated Frame Gap:** This function is only for XM-RM-8XX modules. When enabling this function, 1 bit-time of frame gap will be inserted after a certain amount of packets are sent and decrease packet loss.
- **Halt on if fail:** If you enable this function, system will stop if the test fails.
- **Up Packet Setting:**
 - **Transmit by Time:** The 1 to Many-UC test will be performed for the set amount of time here.
 - **Transmit by Packet:** The 1 to Many-UC test will be performed for the set amount of packet here.
 - **Tx Pkt Timeout:** This field will be available for setting when you select the **Transmit by Packet** function. If the time spent for transmitting packet exceeds the **Tx Pkt Timeout** you set here, the test will stop and the result will be fail.
- **Down Packet Setting:**
 - **Transmit by Time:** The 1 to Many-UC test will be performed for the set amount of time here.
 - **Transmit by Packet:** The 1 to Many-UC test will be performed for the set amount of packet here.
 - **Tx Pkt Timeout:** This field will be available for setting when you select the **Transmit by Packet** function. If the time spent for transmitting packet exceeds the **Tx Pkt Timeout** you set here, the test will stop and the result will be fail.
- **Stream Counter Report:** Click the check box so the APMP-4 will save the 1 to Many-UC test result in Microsoft Excel format.
- **Dynamic Random Seed:** For random packets, selecting this option will generate variable packets, disabling this function will not generate variable packets.
- **T/L (0x):** You can set the T/L (0X) after MAC address in this field.
- **Auto Check X- TAG Offset:** X-TAG is a 12-byte tag which is developed by Xtramus and embedded at 45th~56th bytes of each testing frames generated by Rapid-Matrix for multi-stream tests. X-TAG will be added to all the testing frames generated by NuApps-MultiUnits-RM.
- **Traffic Direction Mode:** You can scroll down and choose the direction of the traffic on this field.
- **Tx Payload:** You can set the content of the transmitting packets with the **Payload** scroll-down menu.
- **MAC Setup:** Clicking the **MAC Setup** option will pop up a window to modify each module card's port **MAC Address**.

5.7.5. 1 to Many-MCV

1 to Many-MCV performs Layer 2 VLAN address multicast performance tests from one source port to multiple destination ports with different media types (such as 100Mbps and 1Gbps Full).

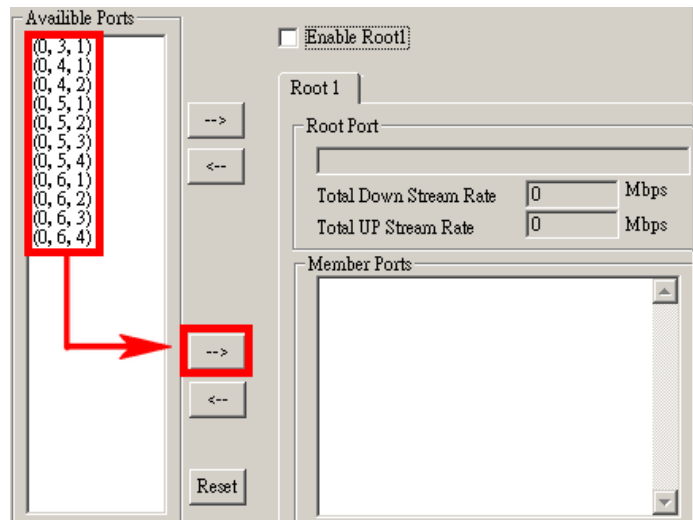

Port Map

Before making any other configurations for **1 to Many-MCV** test, you have to assign a **Root Port** and its **Member Ports** for **Root 1** first. Please note that only Active Ports from module cards **XM-RM731** and **XM-RM891** can serve as **Root Ports**.

To assign an Active Port as the Root Port for Root 1, please click the Active Port you would like to use as a Root Port, and then click the → button to add it to the Root Port field located on the right side. To remove the Root Port you've assigned, click the ← button.

To assign Active Ports as the Member Ports for Root 1, please click the Active Ports you would like to use as Member Ports, and then click the → button to add it to the member Ports field located on the right side. To remove a Member Port you've assigned, click the Member Port you would like to remove, and then click the ← button.

- **Available Ports:** All available Active Ports will be shown in this field. If you assign an Active Port as the Root Port or one of the Member Ports, it will be removed from this field.
- **→/←:** You can add an selected Active Port as the Root Port or one of the Member Ports by clicking the → button, or remove the Root Port or Member Ports by clicking the ← button.
- **Reset:** Click this button to remove all Active Ports that has been assigned as Root Port or Member Ports.
- **Enable Root 1/2:** Click these check boxes to select which Root you would like to use for 1 to Many-UC test.
- **Root 1/Root2:** Click these tabs to choose which Root you would like to view/configure.

Link Status Check OFF

Member Quick Setup

You can set the media type for all the Active Ports that's used for **1 to Many-UC** test here.

- **Media Change:** Turning On or OFF this option will respectively lock or unlock the availability for setting the **Root** and **Member** functions.
- **Root:** You can set the media type (**Speed**, **Flow Control**, **Auto-MDIX**, **Media Select** and **Master Mode**) for the **Root Active Port** of **Root 1** in this field. To configure Root Active Port, please click the scroll-down menu located on the column.
- **Member:** You can set the media type (**Speed**, **Flow Control**, **Auto-MDIX**, **Media Select** and **Master Mode**) for the **Member Active Port** of **Root 1** in this field. To configure Member Active Port, please click the scroll-down menu located on the column. You could also click the **Member Quick Setup** button. A **Quick Setup** window will pop up. The settings you made here will apply to all the Member Ports listed in the **Member** field.
- **Link Status Check:** Select between On to able or OFF to disable the link status check. You can also select the ON & Alarm to activate the link status check with alarm.

Title of task name

Apply

- **Title of task name:** You can assign a name to this task for identification.
- **Apply:** Apply the changes you made.

5.7.6. CALL-EXT

From this task, you can open exe. files from your PC.

The screenshot shows a 'Setup' dialog box for the 'CALL-EXT' task. It has two main sections: 'Path' and 'Condition'. The 'Path' section contains a 'Command' field with a text input area and a browse button (three dots). The 'Condition' section contains two radio buttons: 'Exit by Result' (which is selected) and 'Exit by Time'. Next to the 'Exit by Time' radio button is a text input field with the value '0' and the unit 'sec'.

- **Command:** Write the path of your exe. File on this field.
- **Condition:**
 - **Exit by Result:** Select this option will activate the **Result Option** field.
 - **Exit by Time:** Select this option to set the time for auto exit.
 - **Continue testing automatically after:** set the exit time of the .exe file under the **Exit by Time** mode.

5.7.7. LineEmulate

This task allows you to set the LES-5160 device or other line emulation equipment which connects to DUT ports. The function is active until the next 'LineEmulate' task. LineEmulate must be executed prior to the task which needs the line emulation function and it's of no meaning when tested alone.

LineEmulate

Description

LineEmulate: This function allows you to set the device 5160 or other analog line equipment which connects to DUT port, this config is active until the next 'LineEmulate' task. LineEmulate must be put in front of any task which needs to add length of test line and it's of no meaning when tested alone..

Refresh

Refresh: click this button and the APMP-4 begins to detect the LES-5160 devices on the network.

The list of the detected LES-5160 devices will be added on the margin below.

Description	
A.	This field shows the IP address of the LES-5160 device.
B.	Enable to set wire length: check this function, then you can set the wire length emulated by each XLE-C5E module installed in the LES-5160 chassis.
C.	<p>You can set the wire length emulated by each XLE-C5E module installed in the LES-5160 chassis, respectively.</p> <p>There are three optional wire lengths:</p>

- **Bypass:** 1m approx.
- **Short:** 10m approx.
- **Long:** 100m approx.

If there is no any LES-5160 device detected on the network. The following window will pop up as a reminder.

5.8. Test Tasks – Customization

In this task, it includes the CTM-BSTAR-001 test.

Port Map

- **Test Ports:** The selected ports will be displayed on the **Test Ports** field. Ports are displayed in IDs in the format of **(X, Y, Z)** while **X** is the number of the chassis (which is displayed on NuStreams-2000i/600i), **Y** is the slot number where this model card is installed, and **Z** is the available port number located on the model card.
- **←:** To assign a port from **Ports A List** or **Ports B List**, click a port from **Ports A List** or **Ports B List**, and then click **←** button to add it to the **Port Mapping**.
- **→:** To remove a port from **Port Mapping**, click the port you would like to remove on **Port Mapping** field, and then click **→** button to remove it from **Port Mapping**.
- **Reset:** Remove all port from **Tests Ports** to **Ports A List** or **Ports B List**.

Media Type

- **Ports A/B:**
 - **Media Type:** By clicking the scroll-down menu, you can set the transmitting mode to **Auto** (with auto-negotiation), **Force** (without auto-negotiation), or **Off** (all the ports in this task are link-down).

For **Auto** and **Force** mode, they include **10M/100M Half/Full**, **1G Full** and **10G**. For **Auto Max**, the system will auto-negotiate depending on the maximum capability of each module cards and DUT (Device Under Test).

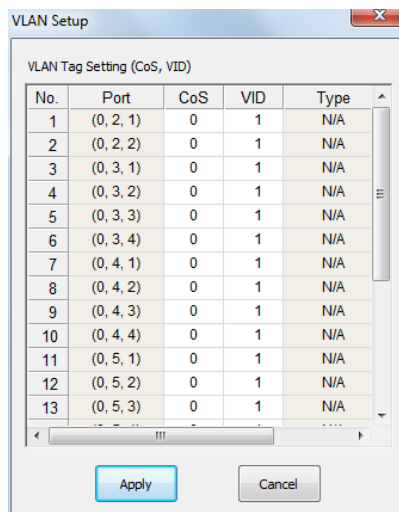

- **Minimum Waiting Time:** APMP-4 will halt at least for the **Minimum Waiting Time** you input here during auto-negotiation process.
- **Media Type Waiting Timeout:** If the time spent for auto-negotiation exceeds the **Media Type Waiting Timeout** you set here, the test will stop and the test result will be fail.
- **Media Select:** Choose between the Copper or Fiber cable that you are using for the test task.
- **Global:**
 - **Link up sequentially:** Enabling this function will allow you to set the time interval for the next auto link.
 - **Link Status Check:** Scrolling down this field to choose between **Abort if Fail** (the system will abort the **Link up sequentially** function if the test fail), **Bypass if Fail** (the system will continue with the **Link up sequentially** function even if the test fail) and **Off** to close this function.
- **Master Mode:** This function is only available when the **Media Type** is set to be **Force-1G**.

Packet

The screenshot shows the 'Packet' configuration tab in the XTRAMUS software. It features two columns for 'Ports A' and 'Ports B' configuration. Each column includes fields for 'Frame Length' (set to 1020), 'Transmit by Time' (checked), 'Frame Count' (set to 10000), 'Run Time' (set to 60 sec), 'Tx Rate' (set to 53 mbps), and 'TxPkt Timeout' (set to 5 sec). There are also checkboxes for 'Add VLAN' and 'Enable Flow Control'. Below these columns are 'Global' settings, including 'Tx Payload' (set to 0x55AA), 'Test Mode' (set to Bi-direction Sequentially), 'Wait for Check Result' (set to 0 sec), 'Wait for Read Counter' (set to 50 ms), and several checkboxes for advanced features like 'Enable X-TAG and Check', 'Enable X-TAG Offset', 'Insert Elongated Frame Gap', 'Transmit by Sequence', 'Halt on if Fail', 'Disable Check Result', 'Enable Backoff limit-4', 'Enable S/N Error Check', 'Enable DI Checksum', and 'Weak Back-off Mechanism'. A 'VLAN Setup' button is located at the bottom left of the Global section.

- **Ports A/B:**
 - **Frame Length:** You can set the frame length from 60~16300 bytes (Byte without CRC).
 - **Transmit by time:** Selecting this option will enable **Run Time** option, and the system will transmit packet during amount of time set on **Run Time** field.
 - **Frame Count:** If you disable **Transmit by time** option, than **Frame Count** option will be available, you can set here the frame count when processing the Learning function.
 - **Tx Rate:** Set the Tx Rate in Mbps in this field.
 - **TxPkt Timeout:** If the Tx packets spent for auto-negotiation exceeds the **Tx Pkt Timeout** you set here, the test will stop and the result will be fail.

- **Add VLAN:** Selecting this function will enable the **VLAN Setup** option on **Common Settings**. VLAN (Virtual LAN) is a group of hosts with common requirements that communicate within the same Broadcast domain regardless of the physical location. By clicking the **Setup** button, you can configure **CoS** (class of service) and **VID** (VLAN ID) on the pop-up **VLAN Setup** window. Click **Apply** and apply all the changes you've made here.

- **Enable Flow Control:** When enabling this function, the transmitting rate will drop if traffic overflow occurs. This function must be enabled under full-duplex.
- **Global:**
 - **Tx Payload:** You can set the content of the transmitting packets with the **Payload** scroll-down menu.
 - **Wait for Check Result:** The system will halt for the time you set here before checking test result.
 - **Wait for Read Counter:** The system will halt for the set microseconds before read the counters. This function is useful for counters since they are stored in memory buffer and the final counter value might take some time to read. Duration time between frames. Increasing Frame Gap reduces the fail rate, while 96 bit-time is wirespeed.
 - **Enable X-TAG and Check:** X-TAG is a 12-byte tag which is developed by Xtramus and embedded at 45th~56th bytes of each testing frames generated by Rapid-Matrix for multi-stream tests. X-TAG will be added to all the testing frames generated by APMPT-4.
 - **Enable X-TAG offset:** X-TAG is a 12-byte tag which is developed by Xtramus and embedded at 45th~56th bytes of each testing frames generated by Rapid-Matrix for multi-stream tests. X-TAG will be added to all the testing frames generated by NuApps-MultiUnits-RM.
 - **Insert Elongated Frame Gap:** When enabling this function, 1 bit-time of frame gap will be inserted after a certain amount of packets are transmitted, and therefore, decrease packet loss.
 - **Transmit by Sequence:** Transmit packet by port sequence.
 - **Halt on if Fail:** When this function is enabled, the test process will halt if Fail occurs.
 - **Enable Backoff limit-4:** The **Backoff limit-4** function is for half-duplex mode only, and its purpose is for collision control. Enabling this function will increase test performance and decrease test fail rate.

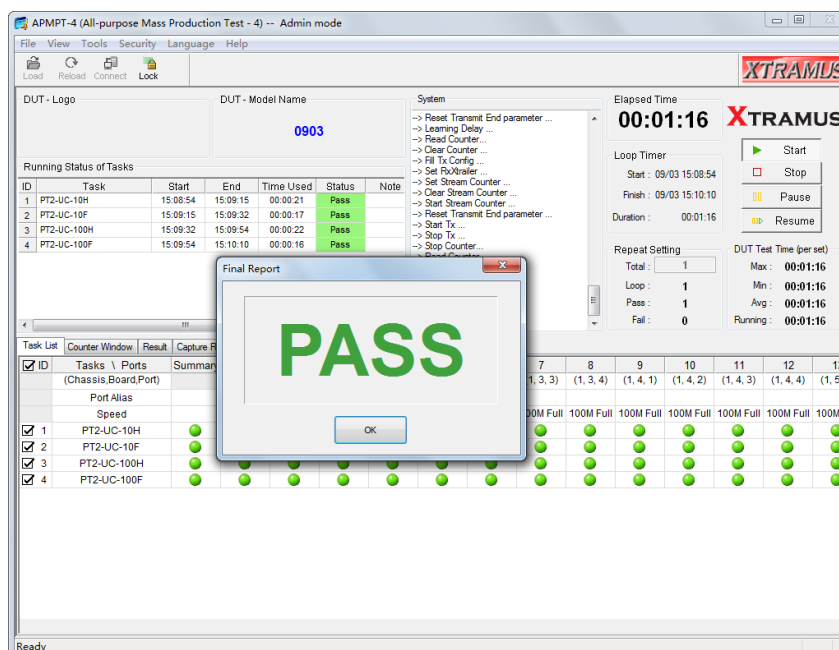

- **Disable Check Result:** When this mode is enabled, all test procedures will be carried out no matter the result is Pass or Fail.
- **Enable S/N Error Check:** Selecting this option will enable the capturing of S/N Error.
- **Enable DI Checksum:** Enable this function to add a tag to the frame for tracking frame integrity.
- **Weak Back-off Mechanism:** When packet collision occurs, the system will wait for at least 1 slot-time before starting to transmit packets again if this function is enabled.

Learning

- **Ports A/B:**
 - **Enable Learning:** Enabling this function allows learning packets transmitted to the DUT before test packets are transmitted. If you disable this function, no learning packets will be transmitted.
 - **Broadcast:** Select the learning packet mode for Broadcast.
 - **Unicast:** Select the learning packet mode for Unicast.
 - **Frame Count:** Repeat frame count per learning packets burst.
 - **Frame Gap:** Duration time between learning frames.
- **Global:**
 - **Tx Pkt Timeout:** If the Tx packets spent for auto-negotiation exceeds the **Tx Pkt Timeout** you set here, the test will stop and the result will be fail.
 - **Delay Time After Learning:** The time gap between after learning and the next process.
 - **Tx Mode:** You can change how packet streams will be transmitted. By clicking the **Tx** scroll-down menu, you can choose **Sync Mode**, **Group Mode** (transmitting gap can be set in the **Gap** field located in the right side), and **Sequence Mode**.
 - **Gap:** Set the transmitting gap for **Group mode**.
 - **Learning by Sequence:** Learning by port sequence.

6. Test Result & Report

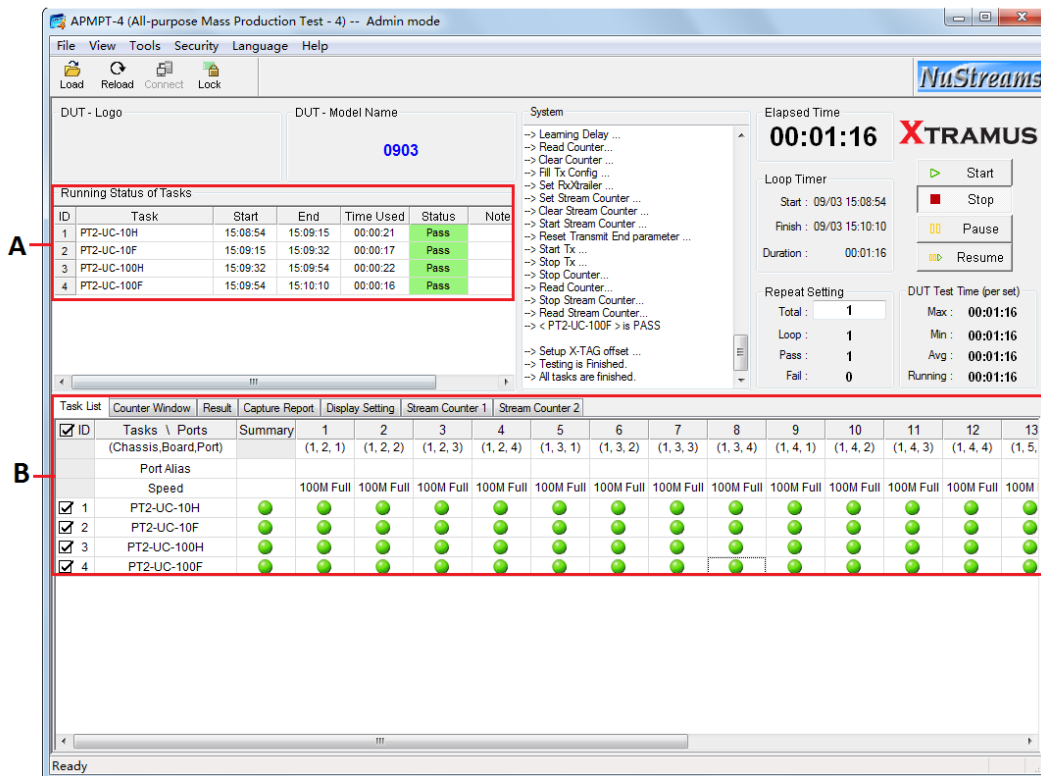

When the test is complete, a **Final Report** window will pop up and tell you the overview test result as show in the figure down below.

A final report of **Pass** will be displayed on the **Final Report** window if all tasks passed. If any one of the task fails, a **Fail** message will be displayed instead.

Press **OK** button on the **Final Report** window to finish the test so you can start another test or start reviewing test results in detail.

For more details regarding to the test result, you can review it on **A. Task Running Status**, or **B. Test Result/Report**. Also, test results are saved as test logs files that can be reviewed as well.

6.1. Task Running Status

ID	Task	Start	End	Time Used	Status	Note
1	PT2-UC-10H	15:08:54	15:09:15	00:00:21	Pass	
2	PT2-UC-10F	15:09:15	15:09:32	00:00:17	Pass	
3	PT2-UC-100H	15:09:32	15:09:54	00:00:22	Pass	
4	PT2-UC-100F	15:09:54	15:10:10	00:00:16	Pass	

You can check the result of each task (Pass or Fail) in the **Task Running Status** field located on APMPT-4's main window.

6.2. Test Result/Report

Task List	Counter Window	Result	Capture Report	Display Setting	Stream Counter 1	Stream Counter 2										
<input checked="" type="checkbox"/> ID	Tasks \ Ports	Summary	1	2	3	4	5	6	7	8	9	10	11	12	13	
	(Chassis,Board,Port)		(1, 2, 1)	(1, 2, 2)	(1, 2, 3)	(1, 2, 4)	(1, 3, 1)	(1, 3, 2)	(1, 3, 3)	(1, 3, 4)	(1, 4, 1)	(1, 4, 2)	(1, 4, 3)	(1, 4, 4)	(1, 5, 1)	
	Port Alias															
	Speed		100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M	
<input checked="" type="checkbox"/> 1	PT2-UC-10H															
<input checked="" type="checkbox"/> 2	PT2-UC-10F															
<input checked="" type="checkbox"/> 3	PT2-UC-100H															
<input checked="" type="checkbox"/> 4	PT2-UC-100F															

You can also view test results in the **Test Result/Report** section from APMP-4's main window as well.

6.2.1. Task List

✓ ID	Tasks \ Ports	Summary	1	2	3	4	5	6	7	8	9	10	11	12	13
	(Chassis,Board,Port)		(1, 2, 1)	(1, 2, 2)	(1, 2, 3)	(1, 2, 4)	(1, 3, 1)	(1, 3, 2)	(1, 3, 3)	(1, 3, 4)	(1, 4, 1)	(1, 4, 2)	(1, 4, 3)	(1, 4, 4)	(1, 5,
	Port Alias														
	Speed		100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M Full	100M
✓ 1	PT2-UC-10H	●	●	●	●	●	●	●	●	●	●	●	●	●	●
✓ 2	PT2-UC-10F	●	●	●	●	●	●	●	●	●	●	●	●	●	●
✓ 3	PT2-UC-100H	●	●	●	●	●	●	●	●	●	●	●	●	●	●
✓ 4	PT2-UC-100F	●	●	●	●	●	●	●	●	●	●	●	●	●	●

You can view all the tasks included in the test, along with the Active Ports that are used in these tasks. The result of these tasks (Pass/Fail) is displayed with green lights or broken red lights.

	Task of the Active Port passes.
	Task of the Active Port fails.

✓ ID	Tasks \ Ports	Summary	1	2
	(Chassis,Board,Port)		(1, 2, 1)	(1, 2, 2)
	Port Alias			
	Speed		100M Full	100M Full
✓ 1	PT2-UC-10H	Port 2 (1, 2, 2) — Pass CardType: XM-RM681 Tx: 500 Rx: 500 CRC Err: 0 X-TAG: 500 DIChecksum Err:0 Dribble Err: 0 Align Err: 0 Under Size: 0 Over Size: 0 Pause: 0	●	●
✓ 2	PT2-UC-10F		●	●
✓ 3	PT2-UC-100H		●	●
✓ 4	PT2-UC-100F		●	●

If you move the cursor to the Green/Red lights, a little window contains detail information will pop up. Information listed in this window includes Task Pass/Fail, Module Card model, transmitting/receiving rate, CRC Error, X-TAG, Dribble Error, Align Error, Under/Over Size Packets, and how many times have you paused the test.

6.2.2. Counter Window

Task List	Counter Window	Result	Capture Report	Display Setting	Stream Counter 1	Stream Counter 2			
Port	Tx Packet	Rx Packet	Tx Byte	Rx Byte	Tx Packet Rate	Rx Packet Rate	Tx Line Rat		
1 (1, 2, 1)	15000	15000	11908896	11908896	0	0			
2 (1, 2, 2)	15000	15000	11908896	11908896	0	0			
3 (1, 2, 3)	15000	15000	11908896	11908896	0	0			
4 (1, 2, 4)	15000	15000	11908896	11908896	0	0			
5 (1, 3, 1)	15000	15000	11908896	11908896	0	0			
6 (1, 3, 2)	15000	15000	11908896	11908896	0	0			
7 (1, 3, 3)	15000	15000	11908896	11908896	0	0			
8 (1, 3, 4)	15000	15000	11908896	11908896	0	0			
9 (1, 4, 1)	15000	15000	11908896	11908896	0	0			
10 (1, 4, 2)	15000	15000	11908896	11908896	0	0			
11 (1, 4, 3)	15000	15000	11908896	11908896	0	0			
12 (1, 4, 4)	15000	15000	11908896	11908896	0	0			
13 (1, 5, 1)	15000	15000	11908896	11908896	0	0			
14 (1, 5, 2)	15000	15000	11908896	11908896	0	0			

You can view all test counters in the **Counter Window**. The **Counter Window** contains three different counter tables: **PT-Counters**, **PoE-Counters**, and **PWR-Counters**.

You can access these different counter tables via clicking the menu-tab located on the bottom of **Counter Window** as shown in the figure down below.

PT-Counters

Task List	Counter Window	Result	Capture Report	Display Setting	Stream Counter 1	Stream Counter 2			
Port	Tx Packet	Rx Packet	Tx Byte	Rx Byte	Tx Packet Rate	Rx Packet Rate	Tx Line Rat		
1 (1, 2, 1)	15000	15000	11908896	11908896	0	0			
2 (1, 2, 2)	15000	15000	11908896	11908896	0	0			
3 (1, 2, 3)	15000	15000	11908896	11908896	0	0			
4 (1, 2, 4)	15000	15000	11908896	11908896	0	0			
5 (1, 3, 1)	15000	15000	11908896	11908896	0	0			
6 (1, 3, 2)	15000	15000	11908896	11908896	0	0			
7 (1, 3, 3)	15000	15000	11908896	11908896	0	0			
8 (1, 3, 4)	15000	15000	11908896	11908896	0	0			
9 (1, 4, 1)	15000	15000	11908896	11908896	0	0			
10 (1, 4, 2)	15000	15000	11908896	11908896	0	0			
11 (1, 4, 3)	15000	15000	11908896	11908896	0	0			
12 (1, 4, 4)	15000	15000	11908896	11908896	0	0			
13 (1, 5, 1)	15000	15000	11908896	11908896	0	0			
14 (1, 5, 2)	15000	15000	11908896	11908896	0	0			
PT-Counters PoE-Counters PWR-Counters									

Table down below is a brief description for all the counters and their meanings:

Tx Packet	Rx IPChksum Error	Rx VLAN	Tx ARP Reply
Transmitted packet	Received IP Checksum Error counts	Received VLAN packet counts	Transmit ARP Reply counts
Rx Packet	Rx Dribble	Rx X-TAG	Tx ICMP Request
Received packet	Received Dribble Error counts	Received X-TAG tagged packet counts	Transmit ICMP Request counts
Tx Byte	Rx Alignment	Rx Undersize	Tx ICMP Reply
Transmitted byte	Received Alignment Error counts	Received undersize packet counts	Transmit ICMP Reply counts
Rx Byte	Rx S/N Error	Rx Oversize	Rx ARP Request
Received byte	Received Serial Number Error counts. (Sequence Error counts)	Received oversize packet counts	Received ARP Request counts
Tx Packet Rate	Rx Latency	Rx 64 bytes	Rx ARP Reply
Transmitted packets per second	Latency time of Received packets	Received 64 bytes length packet counts	Received ARP Reply counts
Rx Packet Rate	Collision	Rx 65-127 bytes	Rx ICMP Request
Received packets per second	Happen times courts of Collision	Received 65-127 bytes length packet counts	Received ICMP Request counts
Tx Line Rate	Rx Pause	Rx 128-255 bytes	Rx ICMP Reply
Transmitted byte per second	Received Pause packet counts	Received 128-255 bytes length packet counts	Received ICMP Reply counts
Rx Line Rate	Rx Unicast	Rx 256-511 bytes	Rx LLDP
Received byte per second	Received Unicast packet counts	Received 256-511 bytes length packet counts	Received LLDP counts.
Rx CRC Error	Rx Multicast	Rx 512-1023 bytes	
Received CRC Error counts	Received Multicast packet counts	Received 512-1023bytes length packet counts	
Rx Fragment Error	Rx Broadcast	Rx 1024-1522 bytes	
Received Fragment Error counts.	Received Broadcast packet counts	Received 1024-1522 bytes length packet counts	
Rx DIChksum Error	Rx IPv4	Tx ARP Request	

Received Data Integrity (2nd level CRC Check) Error counts.	Received IPv4 packet counts	Transmit ARP Request counts
---	--------------------------------	--------------------------------

PoE-Counters

Port	State	Iclass (mA)	Tpdc (ms)	Tmpdo (ms)	Icut (mA)	Tovld (ms)	Ilim (mA)	Tlim (ms)	Current Vrms	Current Irms	Peak V (V)
<div> <div>PT-Counters</div> <div>PoE-Counters</div> <div>PWR-Counters</div> </div>											

- **Iclass (mA):** Classes of power level for PoE connection as listed in the table down below.

Class	Usage	Maximum Power Levels at Input of Powered Device (Watt)
0	Default	0.44 to 12.95
1	Optional	0.44 to 3.84
2	Optional	3.84 to 6.49
3	Optional	6.49 to 12.95
4	Reserved	(PSEs classify as Class 0)

Table down below is a brief description for all the counters and their meanings:

Tpdc (ms)	Ilim (mA)	Peak V (V)	Line Consume Power
Values in milliseconds to classify power level of the PD (Powered Device) for PoE connect	Values of output mA current in short circuit condition For PoE ShortCircuit.	The peak voltage value.	The power that consumed by network cable
Tmpdo (ms)	Tlim (ms)	Peak I (mA)	Watt (W)
Values in milliseconds to turn off power For PoE Disconnect	Time limit in milliseconds in short circuit condition for PoE ShortCircuit.	The peak current value.	Power consumption.
Icut (mA)	Current Vrms	Temperature (°C)	Eq. PD Power (W)
Value of overload current for PoE Overload	Root mean square voltage. A method to calculate average voltage in positive value.	The temperature of the DUT	The equivalent power of power device (PD).
Tovld (ms)	Current Irms	Power	Eq. Line Power (W)
Value of the overload time limit in milliseconds for PoE Overload	Root mean square electrical current. A method to calculate average current in positive value.	DUT On/Off	The equivalent line power.
PSE Type			
The type of PSE protocol supported			

PWR-Counters

Port	RMS Voltage (V)	RMS Current (mA)	Peak Voltage (V)	Peak Current (mA)	Active Power (W)	Apparent Power (V)	Power Factor	AC Frequency
1 (0, 3, 1)	103.709	0.070	103.137	0.174	4.808	7.160	0.648	60

Detail results of the DUT power tests will be displayed here in this field.

The counter listed here includes: **RMS Voltage** (the Root Mean Square Voltage), **RMS Current** (the Root Mean Square Current in mA), **Peak Voltage (V)**, **Peak Current (mA)**, **Active Power (W)**, **Apparent Power (V)**, **Power Factor**, **AC Frequency (Hz)**, and **Temperature (°C)**.

6.2.3. Result

You can view detail text result of any Task by double clicking the **Status** column of that Task, and it will be showed on the **Result** tab menu located on the bottom part of APMPT-4's main window.

You can copy these texts and paste them for reports.

ID	Task	Start	End	Time Used	Status	Note
1	PT2-UC-100F	15:25:05	15:25:22	00:00:17	Pass	

-> Set Stream Counter ...
 -> Clear Stream Counter ...
 -> Start Stream Counter ...
 -> Reset Transmit End parameter ...
 -> Start Tx ...
 -> Stop Counter...
 -> Read Counter...
 -> Stop Stream Counter...
 -> Read Stream Counter...
 -> < PT2-UC-100F > is PASS
 -> Setup X-TAG offset ...
 -> Testing is Finished.
 -> All tasks are finished.

Start : 09/03 15:25:05
 Finish : 09/03 15:25:22

6.2.4. Capture Report

No.	Destination	Source	Length	Type	Data

Task Select

ID1 PT2-UC-100F

Port Select

Port 1(1,2,1)
Port 2(1,2,2)
Port 3(1,2,3)
Port 4(1,2,4)
Port 5(1,3,1)
Port 6(1,3,2)
Port 7(1,3,3)

You can view captured packets in the **Capture Report**. To show the packets captured, please choose the Task first as shown in the figure on the right side, and choose the Active Port.

Captured packets will be shown in the field down below after you've chosen the **Task** and the **Active Port**.

6.2.5. Display Setting

Task List

☒ Standard column width
☐ Narrow column width

You can set how the **Task List** will be displayed with **Display Setting**.

- **Standard Column Width:** Display Task List with wide columns.
- **Narrow Column Width:** Display Task List with narrow columns.

Task List	Counter Window	Result	Capture Report	Display
<input checked="" type="checkbox"/> ID	Tasks \ Ports	Summary	1	2 3
	Chassis		1	1 1
	Board		2	2 2
	Port		1	2 3
	Port Alias			
	Speed		DM	FOM FOM F
<input checked="" type="checkbox"/> 1	PT2-UC-10H			
<input checked="" type="checkbox"/> 2	PT2-UC-10F			
<input checked="" type="checkbox"/> 3	PT2-UC-100H			
<input checked="" type="checkbox"/> 4	PT2-UC-100F			

6.2.6. Stream Counter Root 1/2

Task List	Counter Window	Result	Capture Report	Display Setting	Stream Counter 1	Stream Counter 2				
SPort	DPort	Tx Packets	Rx Packets	Tx Bytes	Rx Bytes	Rx Line Rate	Rx Lost Packet	Rx S/N Error	Rx IPCS Error

(1, 5, 3)	(1, 5, 4)	15000	15000	11908896	11908896	0	0	0	0	
(1, 5, 4)	(1, 5, 3)	15000	15000	11908896	11908896	0	0	0	0	

Detail results of **1 to Many-US** will be displayed here in this field.

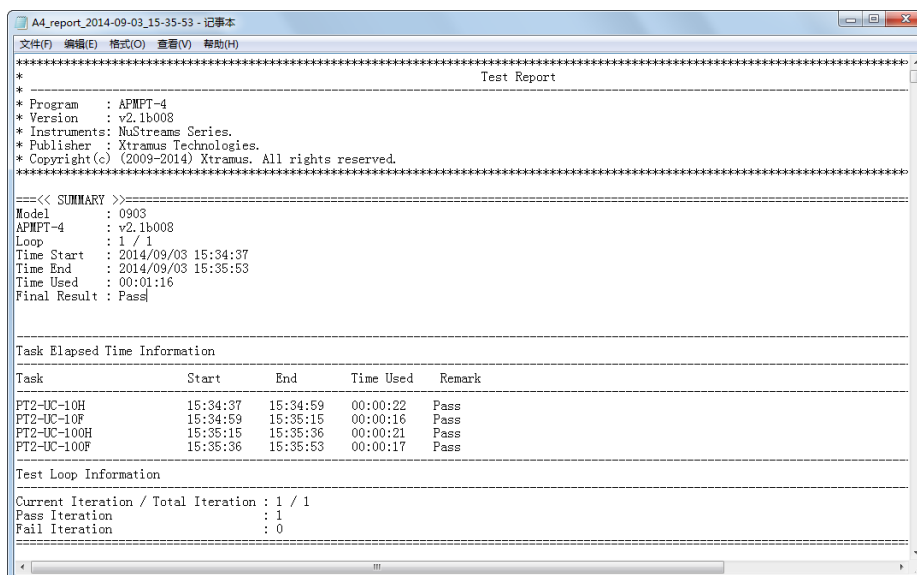

The counter listed here includes: **DPort** (Destination Port), **Tx Packets** (Transmitted Packets), **Rx Packets** (Received Packets), **Tx Bytes** (Transmitted Bytes), **Rx Bytes** (Received Bytes), **Rx Line Rate** (Received Line Rate), **Rx Lost Packet** (Packets lost while receiving), **Rx S/N Error** (S/N Error while receiving), and **Rx IPCS Error** (IPCS Error while receiving).

6.3. Test Report

APMPT-4 regenerates test results automatically after tests have been finished. To view the test result for the current test, choose **View** on the **Menu Bar**, and then choose **Latest Log**.

The test log will be displayed with Microsoft ® Notepad.

You can choose to open the **Log Folder** and view all the saved log files as well by clicking **View** on the **Menu Bar**, and then choose **Log Folder**.
